elevates it a semitone in the scale, raising, for example, F to F sharp. b lowers the note by a semitone, depressing B to B flat. When a note which has been elevated by a sharp, or depressed by a flat, is to be restored to its original place, the character  $\natural$  (natural) is prefixed to it.

The names of the intervals correspond to the

# MUSIC.

ees of the staff, but it has been seen that  
ervals of the same name are not necessarily  
l. If the sign of a flat or a sharp be prefixed to  
er note of an interval, it still preserves its name  
third, a fifth, &c.; but to distinguish intervals  
he same degree, the qualifying epithets of major  
minor, augmented and diminished, are used.

The different keys in music are best understood  
by reverting to the scale of triads, on which the  
diatonic scale is founded. Taking a series of triads,  
of which the dominant of each is the key-note of the  
next, we obtain the following scale, extended both  
upwards and downwards from C:

ach triad is composed of the key-note, its mediant,  
dominant, and the scale of each key is composed  
he triad of the key-note, with the triad imme-  
ely preceding and that immediately following it.  
h key is succeeded by the key of its dominant.  
if we begin with the key of C (in the middle of  
scale), each key acquires an additional sharp till  
reach the key of F# with six sharps. These are  
sharp keys. If, beginning again with the key of  
e go back instead of forward in the scale of  
ds, we obtain the flat keys; each key has an  
itional flat to that above it, till we come down  
he key of Gb with six flats. This key in instru-  
ts with temperament is exactly the same with

that of F# and on this account it is not generally  
found convenient to extend the keys beyond six, or  
at most seven, sharps or flats. G# with seven sharps  
is the same as Db with five flats, and Cb with  
seven flats is the same as B with five sharps. In  
music written in these keys, double sharps and  
double flats occur, which are indicated by the  
characters x and bb respectively. In writing music  
in any key with sharps or flats, it is usual, instead  
of prefixing the sharp or flat to each note when  
required, to place the sharps and flats belonging  
to the key together after the clef, on the degree to  
which they belong, and such collections of sharps or  
flats are called the signature.

## SIGNATURES OF THE SHARP KEYS.

## SIGNATURES OF THE FLAT KEYS.

arp or flat introduced in a composition which  
not appear in the signature, is prefixed to the  
and called an accidental.  
e diatonic scale and keys above described  
ag to what is called the major mode; there is  
another mode in use called the minor mode.  
he minor, as in the major mode, the diatonic  
and the keys are based on the scale of triads.  
t of the triads already considered consists of  
unequal intervals, called a major third and  
er third. Supposing we begin with the minor  
ad of the major third, we have a succession of  
ds taking their minor third from one triad and  
major third from another. These compound  
ds are called minor triads. Their proportion  
t 10, 12, 15, and out of three such consecutive  
r triads the scale of the minor mode is con-  
cted.

D F A C E G B  
80, 96, 120, 144, 180, 216, 270

Multiplying D and F by 2, and dividing B by 2,  
to bring the whole within the compass of an octave,  
we have:

A B C D E F G A  
120, 135, 144, 160, 180, 192, 216, 240.

The scale here represented is what is known as  
the descending scale of the minor mode. When  
the seventh of the scale ascends to the eighth, it  
becomes sharp, as the proper leading note or sharp  
seventh to the tonic. This sharp is, however,  
always omitted from the signature, and placed  
accidentally before the seventh which it is to  
elevate. In order to avoid the harsh interval of  
the augmented second (from F to G#), it is usual in

# MUSIC.

the ascending scale to make the sixth sharp also, in order to accommodate the seventh; thus the

ascending or accidental scale of the minor mode two notes altered from the signature.

## ASCENDING SCALE.

## DESCENDING SCALE.

Each minor scale is called the relative minor to the major scale on its right hand in the scale of triads, with which it has the same signature: thus the relative minor scale to C major is that of A minor.

Each minor scale is also called the tonic minor to the major scale on the same key-note, from which it differs in flattening the third of its tonic, and the descending scale also the third of its subdominant. The tonic minor scale to C major is C minor.

C major F A C E G B D  
A minor D F A C E G B

## C MAJOR.

## C MINOR.

As the descending scale regulates the signature, each tonic minor has three flats more, or three sharps less in its signature than its major.

## F MAJOR.

## F MINOR.

## A MAJOR.

## A MINOR.

## G MAJOR.

## G MINOR.

In this last example, F#, B#, and E# are all considered sharps in contrast with Fb, Bb, and Eb of the minor scale.

**Rhythm.**—In musical notation, the relative duration of notes is indicated by their form. Notes may be open or close; they may consist of a head only, or of a head and stem. Where there is a stem, it may be turned up or down, according to convenience. The semibreve, the longest note in ordinary music, is open, and consists of a head only (C). The minim is an open note with a stem, half the length of a semibreve; the crotchet is a close note with a stem, half the length of a minim; the quaver is a close note with a stem and hook, half the length of a crotchet; a quaver is further divided into two semiquavers with two hooks; four demi-semiquavers with three hooks; and eight semi-demi-semiquavers with four hooks. In

equivalent in time to two minims, four crotchets, eight quavers, sixteen semiquavers, thirty-two demiquavers, and sixty-four semi-demi-semiquavers. The notes formed with hooks may be grouped

together . In

music this is not done except when a group is sung to one syllable. When a dot is placed after a note, it is lengthened by one-half; when two dots, it is lengthened by three-fourths.

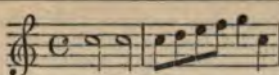

Every piece of music is divided into portions equal in time, called measures, which are separated from each other by vertical lines called bars. The term bar is often loosely used to denote the measure as well as the line. The length of the measure is indicated by a sign at the beginning of the movement. In common

time, indicated by the sign each measure includes a semibreve, or its equivalent made

slow religious music, an open square note, called a breve, sometimes occurs. The semibreve is

# MUSIC.

es of lower value: 

other measures of time have for their signatures figures placed as a fraction, one over the other. The figures of the denominator are either 2, 4, 8, or 16, which stand for minims, crotchets, quavers, and sixteenths respectively (i.e., halves, fourths, &c., of a semibreve); the numerator indicates the number of these fractional parts of a semibreve contained in each measure. There is another form of common time besides that already noticed, which is called half-time, has a minim or two crotchets in

the measure, and is known by the signature  $\frac{2}{4}$

i.e., two crotchets—

When there are three minims, crotchets, or quavers in a measure, the piece is said to be in triple time,

its signature being  $\frac{3}{2}$ ,  $\frac{3}{4}$  or  $\frac{3}{8}$ .

When two or four measures of triple time are put in one measure, the movement is said to be in compound common time. Its usual forms are

indicated by the signatures  $\frac{6}{4}$  and  $\frac{6}{8}$ .

In the first, there are three submeasures of three crotchets; in the second, two submeasures of three

quavers. Compound triple time occurs where there are nine crotchets in a measure, either crotchets, quavers, or sixteenths, grouped in threes. Its signatures are

$\frac{9}{8}$  and  $\frac{9}{16}$ . A variety occasionally occurs in simple or triple time by the measure note being divided into three, or even five

sevens, instead of two parts, which are grouped together, sometimes with the figure 3, 5, or 7, placed

The object of the division of musical passages into measures is to indicate their rhythm, a quality forming an essential element in the pleasure derived from music. Notes of music, like words or syllables, are accented or unaccented. The principal accent is given to the first note of a measure. Of the four measure notes in common time, the third has also a subordinate accent, as has the third measure note in triple time. There are occasions when a strong accent, or emphasis as it is called, is laid on the part of the measure which is usually unaccented; this the composer indicates by the Italian terms *rinforzando*, *sforzato*, abbreviated *rinf.*, *sf.*

When in the course of a movement silence is required for a time, this is indicated by a rest or rests corresponding to that time; the breve, semibreve, minim, &c., have each their respective rests, which are represented as follows:—

Breve. Semibreve. Minim. Crotchet. Quaver. Semiquaver. Demi-semiquaver. Semi-demi-semiquaver.

A rest may, like a note, be dotted to indicate the duration of half to its length.

The double bar  consists of two strong vertical

lines, placed at the end of a musical composition, and also at other parts (not necessarily coincident with the end of a measure) where a rhetorical division of a movement terminates. When dotted on one side, all the measures on the side with the dots are to be repeated from the beginning, or from the antecedent double bar.

A tie is an arch placed between two notes on the same degree, to indicate that instead of the two notes being written, one note is to be played of the value of both. When the last note of one measure is thus connected with the first of the next measure, the former, though naturally the accented note, acquires the emphasis—

When the same arch is drawn over two or more notes on the same degree, it is called a slur, and

merely indicates that they are to be played smoothly

or fluently (*legato*) 

When notes are to be played short, distinct, and detached (*staccato*), a dot is placed over them. A dash implies a greater, and the union of dot and slur a less degree of staccato—

The pause  placed over a note indicates a delay in the time of the movement, and a continuance of the sound made on that part of the measure.

The various degrees of softness and loudness which occur in a piece of music are indicated by the letter *f* for *forte*, loud; *p* for *piano*, soft, also *pp* for *pianissimo*, very soft; *mf* for *mezzo forte*, rather loud, and *ff* for *fortissimo*, very loud. A gradual increase of loudness is denoted by the word *crescendo*, or the sign  $<$ ; and a diminution from loud to soft by the word *diminuendo*, or the contrary sign  $>$ . Many other expressions are used in the body of written music, indicating

slowness, quickness, and the character of execution. The most important of them are explained under separate articles—as are the various musical graces or embellishments known under the names of the Appoggiatura, Beat, Shake, and Turn. Among abbreviations in frequent use are a line drawn over or under a semibreve, or through the stem of a minim or crotchet, to divide it into quavers; or a double line, to divide it into semiquavers. Two minims may be connected to indicate their repetition as quavers. Thus—

**Harmony.**—We have mentioned that when a string is struck, its harmonics are more or less distinctly heard along with it. This arises from the string spontaneously dividing itself into aliquot parts—as one-half, one-third, one-fourth, one-fifth, one-sixth, one-seventh, &c., of the string. The numbers 2, 3, 4, 5, 6, 7, expressing the relative number of vibrations in a given time, are a measure of the pitch of the note, and placed proportionally to one another, or in the form of a fraction, they are a measure of the interval. The prime numbers 2, 3, 5, and 7, and their compounds, constitute the harmonics of a musical sound; no division by a higher prime number is tolerable to the ear along with the fundamental note, and no sound corresponding to such division is audible in the vibrations of a string—

The degrees of the harmonic scale consist of intervals decreasing in a geometrical ratio from the octave to the minor tone, viz.—

1 : 2 Octave.	6 : 7 Grave third.
2 : 3 Fifth.	7 : 8 Tone maximus.
3 : 4 Fourth.	8 : 9 Tone major.
4 : 5 Major third.	9 : 10 Tone minor.
5 : 6 Minor third.	

Other intervals more or less consonant are to be found in the harmonic scale, of which the most important is 4 : 7, the grave seventh. From this scale is derived the triad, which we have seen to be the foundation of the diatonic scale, and also the whole theory of chords.

The first five notes of the harmonic scale are the component parts of the major common chord, by far the most consonant chord that can be produced by five notes. Neglecting octaves, its essential notes are the major triad, C E G, or 4, 5, 6, which, as already seen, consists of a fifth divided harmonically into major third and minor third. The root on which a chord is formed, or the note by whose division into aliquot parts the notes of the chord are produced, is called its fundamental bass, and the fundamental bass of the triad C E G is C. The common chord is the triad with the addition of the octave of the root; its proportions are 4, 5, 6, 8.

Every key contains within itself two other triads besides that of the key-note—viz., those of the subdominant and dominant, which have the subdominant and dominant of the key-note respectively for their fundamental basses; and the feeling of satisfaction produced by the diatonic scale arises out of the fact, that its notes belong to a progression of chords formed on a fundamental bass suggested by the ear. This fundamental bass is here indicated on the lower staff—

The relative position of the notes of a chord, and consequently its intervals, may be altered by raising one or more of them an octave; and, on the whole, the nearer the intervals approach to their position in the harmonic scale, the purer is the harmony. Close, in contradistinction to dissonant harmony, is when the notes of a chord are so near that no component note could be placed between them. When the fundamental bass of a chord ceases to be its lowest note, the chord is said

to be inverted. Thus and

are inversions of the common chord, but not

where the fundamental bass is still the lowest note.

The minor triad is, as we have seen, a compound chord, whose ratio is 20, 24, 30, taking its minor third from the triad below, and its major third from the triad above. Its fundamental bass is the key-note. The minor mode has, like the major, three triads in each key—those of the tonic, subdominant, and dominant; and the minor common chord admits of the same inversions as the major, by making the third or fifth the lowest note.

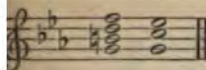

The first seven notes of the harmonic scale contain the chord next in consonance to the common chord, the chord of the seventh or dominant harmony. Rejecting octaves, it is the harmonic triad with the addition of the grave seventh, 4, 5, 6, 7, C E G Bb, or G B D F, and admits of three inversions, according as the third, fifth, or seventh is taken instead of the root as the lowest note. This chord belongs to the key of which its fundamental note is the dominant; and in order to satisfy the ear, it requires to be followed by a resolution into the common chord of the key, or one of its inversions, the major third rising a semitone to the key-note, and the seventh descending one degree—

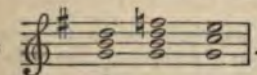

The dominant seventh note is flatter by an interval of 63, 64 than the subdominant of the key, though the two are not distinguishable on keyed instruments. The chord of the dominant seventh is the same in the tonic minor as in the major mode, but differs in its resolution, in respect that it descends a tone instead of a semitone.

# MUSIC.

. The dominant harmony

affords numerous means of modulating from one key to another. For example, the addition of a dominant seventh to the common chord of a key, effects a modulation into the key of the sub-

dominant . In modulat-

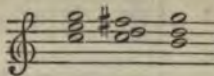

the chord of the added ninth, consisting of the dominant harmony (its root generally omitted) with the fifth of the adjacent triad above. 2, 3, and 4, the different forms of the added sixth, or chord of the subdominant. 2 is the triad of the subdominant, with the third of the adjacent triad below, or rather its octave; 3 is the triad of the subdominant, minor mode, with the third of the adjacent triad below; and 4, the same triad with the third of the tonic major to the adjacent triad below. 5, the diminished seventh, a compound of the characteristic notes (B F) of the dominant harmony of the major mode with those (G# D) of the relative minor. 6, 7, and 8, the augmented sixths, all dominant harmonies, resolving into the major tonic. 6, called the Italian sixth (F A D#), is a compound of the characteristic notes (A D#) of the dominant harmony of the minor mode (B D# F A) inverted, with the dominant seventh note (F) of the major triad (C E G) below for a bass; 7, the French sixth (F A B D#), the same as the last, with the addition of the octave to the fundamental bass; 8, the German sixth (F A C D#), compounded of the characteristic notes of the dominant harmony of the minor mode inverted, with the dominant sevenths of the major triads below and above.

All classical harmonies can be reduced to the chords enumerated, varied by inversions, omissions, suspensions, and pedal basses. A pedal bass or organ-point is a bass note sustained through a progression of chords, to only the first and last of which it is the proper bass. The pedal bass of the tonic is often used with the chord of the dominant seventh, the added ninth, and the diminished seventh, and occasionally with other chords: sometimes the pedal harmonies are taken on the dominant instead of the tonic, and the holding note sometimes occupies an upper part instead of the bass—

ing into the key of the dominant, the supertonic bears the dominant harmony, and becomes domi-

nant of the new key . For

other modulations, we must refer to works on the theory of music.

The following more complex harmonies are also in general use—

A musical composition consists of a succession of notes or of chords subject to certain laws. Like discourse, music has its phrases, periods, and punctuation. When a piece of music continues in the same key, it is said to move by progression, a term used in contradistinction to modulation, where the key is changed. Progression in music of two parts is of three kinds—oblique, when one part repeats or holds on the same note, while the other moves up and down; direct, where both parts move in the same way; and contrary, where one moves up, and the other down. Consecutive chords should in general be connected, either as having some note in common, or as being the chords of closely connected keys. There are certain chords which require a special resolution—i.e., they must be followed by certain other chords; and there are certain progressions which, from harshness, are in ordinary cases to be avoided, more particularly consecutive fifths, and consecutive octaves, the latter, however, being admissible when used merely to strengthen a part. Modulation is generally effected by introducing the chords common to both keys, and the secret of good modulation consists in the skilful choice of intermediate chords. Every regular piece of music is composed in a particular key, in which it begins and ends, and which predominates over all the other keys into which it has modulated. The keys into which a key most readily modulates, are those most nearly related to it—viz., the dominant, the subdominant, and the relative and tonic major or minor. We have seen how modulation may take place by introducing the dominant harmony of the new key or one of its inversions, and in this way the entire harmonic circle of the keys can be made, either by ascending or descending fifths; but in order to effect this change, it will be necessary, on reaching the key of C# with seven sharps, to substitute, by what is called an Enharmonic (q. v.) change, D# with five flats, or vice versa, which on instruments with temperament produces no real change on the pitch, but merely on the names of the notes.

The arrangement of chords which the ear naturally expects at the close of a strain is called a cadence; it corresponds in music to the period which closes a sentence in discourse. It is perfect when the harmony of the dominant precedes the harmony of the key-note, and imperfect when the harmony of the key-note precedes that of the dominant without its seventh.

The imperfect cadence is the most usual termination of a musical phrase, or short succession of measures containing no perfect musical idea. A portion of melody formed of two regular phrases, and containing a perfect musical idea, is called a section, and its regular termination is the perfect cadence.

# MUSIC—MUSK.

Music is produced by the human voice, and by a variety of artificial instruments. For the application of the voice to musical purposes, see SINGING. Musical instruments are classified as stringed instruments, wind instruments, and instruments of percussion. In some stringed instruments, as the pianoforte, the sounds are produced by striking the strings by keys; in others, as the harp and guitar, by drawing them from the position of rest. In a third class, including the violin, viola, violoncello, and double bass, the strings are put into vibration with a bow. In wind instruments, the sound is produced by the agitation of an enclosed column of air; some, as the flute, clarinet, oboe, bassoon, flageolet—instruments of wood, and the trumpet, horn, cornet-a-piston, &c., of metal, are played by the breath; in others, as the organ, harmonium, and concertina, the wind is produced by other means. In the two last-named instruments, the sound is produced by the action of wind on free vibrating springs or reeds. Instruments of percussion are such as the drum, kettle-drum, cymbals, &c. The chief peculiarities of the more important musical instruments are noticed in special articles.

Musical compositions are either for the voice, with or without instrumental accompaniment, or for instruments only. Of vocal music, the principal forms may be classed as church music, chamber music, dramatic music, and popular or national music. The first includes plain song, faux-bourdon, the chorale, the anthem, the sacred cantata, the mass and requiem of the Roman Catholic Church, and the oratorio. Vocal chamber music includes cantatas, madrigals, and their modern successors, glees, as also recitatives, arias, duets, trios, quartetts, choruses, and generally all forms, accompanied or unaccompanied, which are chiefly intended for small circles. Dramatic music comprehends music united with scenic representation in a variety of ways, in the ballet, the melodrama, the vaudeville, and the opera, in which last, music supplies the place of spoken dialogue. Instrumental music may be composed for one or for more instruments. The rondo, the concerto, the sonata, and the fantasia generally belong to the former class; to the latter, symphonies and overtures for an orchestra, and instrumental chamber music, including duets, trios, quartetts, and other compositions for several instruments, where each takes the lead in turn, the other parts being accompaniments. These and other forms of composition will be found noticed separately.

*History of Music.*—A certain sort of music seems to have existed in all countries and at all times. Even instrumental music is of a very early date: representations of musical instruments occur on the Egyptian obelisks and tombs. The music of the Hebrews is supposed to have had a defined rhythm and melody. The Greeks numbered music among the sciences, and studied the mathematical proportions of sounds. Their music, however, was but poetry sung, a sort of musical recitation or intoning, in which the melodic part was a mere accessory. The Romans borrowed their music from the Etruscans and Greeks, and had both stringed instruments and wind instruments.

The music of modern Europe is a new art, with

which nothing analogous seems to have existed among the nations of antiquity. The early music of the Christian Church was probably in part of Greek and in part of Hebrew origin. The chorale was first sung in octaves and unisons. St Ambrose, Gregory the Great directed their attention to improvement, and under them some sort of harmony or counterpoint seems to have found its way into the service of the church. Further advances were made by Guido of Arezzo, to whom notation in lines and spaces is due, but the ecclesiastical music had still an uncertain tonality and an uncertain rhythm. Franco of Cologne, in the 13th c., indicated the duration of notes by diversity of form. The invention of the organ, and its use in accompanying the chorale, had a large share in the development of harmony. Along with the music of the church, and independently of it, a secular music was making gradual advances, guided more by taste than by science; it seems to have had a more decided rhythm, though not indicated as yet by bars. The airs which have become national in different countries were developments of it, but it had its chief seat in Belgic Gaul; and the reformation of musical science with musical art began in Flanders by Josquin Deprès in the 15th c., was completed in the 17th c. by Palestrina and his school at Rome, and reacted eventually on the ecclesiastical style. The opera, which appeared nearly contemporaneously with the Reformation and revival of letters, greatly enlarged the domain of music. Italy advanced in melody, and Germany in harmony. Instrumental music occupied a more and more prominent place. Corelli's compositions exalted the violin. Lulli and Rameau, with their ballet-like music, seized the characteristics of French taste till the German Glück drove them out of the field. The scientific and majestic fugue reached its highest perfection under J. S. Bach. The changes introduced in ecclesiastical music in England at the Restoration gave birth to the school of Purcell, and a little later, England adopted the German Handel, who was the precursor of Haydn, Mozart, Beethoven, Spohr, and Mendelssohn. A school is recently sprung up in Germany, of which Wagner is the chief exponent, whose aim is to create a new style of music; but a number of the works of the school of 'music of the future' are only remarkable for purposeless modulation, and want of coherence.

For further information, reference is made to Pepusch's *Treatise on Harmony*, Dr Calkott's *Musical Grammar*, Sir John Hawkins's and Dr Burney's *History of Music*, Dr Marx's *Allgemeine Schule der Musik*, and Brown's *Elements of Musical Science*.

**MUSK**, or MUSK DEER (*Moschus moschiferus*), a ruminant quadruped, the type of the family *Moschidae*. This family differs from *Cervidae* (Deer) in the want of horns, and in the long canines of the males, projecting beyond the lips. The *M.* is an inhabitant of the elevated mountainous regions of the table-lands of Central Asia. The habits of the *M.* are very similar to those of the *Chamois*. Its favourite haunts are the tops of pine-covered mountains, but its summer range extends far above the region of pines. Its habits are nocturnal and solitary, and it is extremely timid. It is much pursued

## MUSK DUCK—MUSK OX.

rs on account of its odoriferous secretion, as been known in Europe since the and is much valued as a perfume. This musk, is produced in a glandular pouch in the hinder part of the abdomen of the and its natural use seems to be that of sexual attractiveness. The musk-bag is y an infolding of a portion of the skin of within which a number of membranes are , and between these membranes are glands the musk is secreted. When newly taken animal, musk is soft and almost resembles ent; it is reddish-brown, and has an exces- werful odour. Very little of it reaches adulterated.—Musk is usually imported the form of *grain-musk*, that is, the ich has been collected chiefly from stones ich it has been deposited by the animal, state it is a coarse powder of a dark- lour; or in the *pod*, that is, in the musk- h is cut altogether from the animal, and th the musk inside. Of both kinds the mportations are about 15,000 ounces per chiefly from China and India. Small s are used in medicine, but the greater s employed by the perfumers. It is im- small boxes or caddies, often covered ht-coloured silk, and each containing 25 e kinds generally known in trade are the or Chinese, which is worth two guineas in the *pod*, or £3, 10s. per ounce in d the Cabardine, Kabardine, or Siberian, always imported in *pod*, and is very eing only worth about 15s. an ounce. sh of the M. is sometimes eaten, but has strong flavour. The season of migration highest and coldest to more temperate s that at which the M. is chiefly pursued. er animal of the family *Moschidae* yields ame called musk, or has more than a ary musk-bag. The other species of e belong to the genus *Tragulus*, and he popular name *Chevrotaïn*. They have longated muzzle; and the accessory hoofs he form of appressed conical claws. They he thick woody copses or jungles of the lands, and are the smallest of ruminant ds. Some of them are not larger than a hare. ks are not so long as those of the Musk. hem, the *Napu* of Java and Sumatra, has est blood corpuscles of any known animal.

**MUSK DUCK** (*Cairina moschata*), a species of

tubercle at the base of the bill, the edges of the mandibles sinuated, the face and lores covered with a bare tuberculated skin, the wings furnished with a knob or spur at the bend. The M. D., or Muscovy Duck—so called, however, through mistake, and receiving its name M. D. more appropriately from its musky smell—is a native of the warm parts of America. It is very plentiful in Guiana, in that part of the year when winter reigns in the north. It is a larger bird than the common duck, in its wild state almost black, with glosses of blue and green, and white wing-coverts, but varies considerably in domestication. It is often to be seen in poultry-yards in Britain, but is rather curious than profitable. It hybridises readily with the common duck, but the hybrid is sterile.—The M. D. of Australia is a very different species, belonging to the genus *Biziura*.

**MUSK OX** (*Bos moschatus*, or *Ovibos moschatus*), an animal of the family *Bovidae*, regarded as a connecting-link between oxen and sheep. It inhabits the most northern parts of America, enduring the winter even of Melville Island and Banks' Land; but, like many other animals, it is partially migratory, some individuals or herds seeking more southern regions and better pastures on the approach of winter, whilst some remain in the furthest north.

Musk Ox (*Bos moschatus*).

It is not found in Greenland, Spitzbergen, or Siberia. The M. O. is scarcely equal in size to the smallest of Highland cattle, but appears larger from the profusion of long matted woollen hair with which it is covered, and which hangs almost to the ground. The head is covered with long hair as well as the body, the face alone having short hair. Beneath the long hair there is a thick coat of exquisitely fine wool. The head is large and broad; the forehead convex; the extremity of the muzzle hairy. The horns are very broad at the base, and in the male meet on the forehead; they do not rise but bend down on each side of the head, and curve outwards and upwards towards the tip, which tapers to a sharp point. They are about two feet long measured along the curvature; and about two feet in girth at the base; a pair of them sometimes weighing sixty pounds. The limbs are short, the legs have short hair. The tail is very short, and is covered with long hair, so that it is undistinguishable to the sight. The general colour is brown. The female is smaller than the male, has shorter hair on the chest and throat, and smaller horns. The frog of the hoof is short, and partially covered with hair; the foot-marks are very similar to those of the reindeer.

The M. O. feeds on grass, twigs, lichens, &c. It is fleet and active, very sure-footed on rocky ground, and ascends or descends very steep hills with great ease. It is gregarious; the herds generally number

Duck (*Cairina moschata*), Male and Female.

the non-oceanic section of *Anatidæ* (see of a genus characterised by an elevated

# MUSK PLANT—MUSKETRY.

thirty or forty. The powerful horns are excellent weapons of defence against wolves and bears, which are often not only repelled but killed. When musk oxen are assailed by firearms, however, they generally huddle more and more closely together, and do not even seek safety by flight, so long as the assailants are unseen. The flesh is much prized by the Esquimaux, but retains much of the strong musky odour which characterises the living animal. The horns are used for various purposes; particularly the wide base for vessels. The fine wool has been spun and woven into a fabric softer than silk. No attempt has yet been made to domesticate the M. O.; which, however, seems worthy of it, and suitable for all cold regions.

**MUSK PLANT, MUSK ROOT, MUSK TREE, MUSK WOOD.** Different parts of a number of plants smell more or less strongly of musk. Among these are the common little Musk Plant (see *MIMULUS*), the Musk-tree of Van Diemen's Land (see *ASTER*), and the Musk Ochro (see *HIBISCUS*).—The musk-tree of Jamaica (*Moschoxyllum Swartzii*) belongs to the natural order *Melaceae*. It emits from all parts a smell of musk.—All parts of *Guarea grandifolia*, another tree of the same order, a native of the West Indies, sometimes called musk wood, also smells strongly of musk, but particularly the bark, which is used in perfumery.—The drug called MUSK ROOT or *SAMBUL* is brought from the East, and is the root of a plant supposed to be of the natural order *Umbellifere*; but the plant is unknown, nor is it certain whether its native country is Persia, or some more remote region of Central Asia. It has a pure musky odour, and is used as a substitute for musk.

**MUSK RAT, or DESMAN** (*Mygale* or *Galemys*), a genus of insectivorous quadrupeds of the Shrew (q. v.) family (*Soricidae*), differing from the true Shrews (*Sorex*) in having two very small teeth between the two large incisors of the lower jaw, and the upper incisors flattened and triangular. Behind these incisors are six or seven small teeth (lateral incisors or false canine teeth) and four jagged molars. The muzzle is elongated into a small flexible proboscis, which is constantly in motion. The eyes are very small; there are no external ears; the fur is long, straight, and divergent; the tail long, scaly, and flattened at the sides. All the feet have five toes, fully webbed; and the animals are entirely aquatic, inhabiting lakes and rivers, and making holes in the banks with the entrance from beneath the surface of the water. Only two species are known, one (*M.* or *G. Pyrenaica*) about

Musk Rat, or Desman (*Mygale Pyrenaica*).

eight inches long, with tail as long as the body, a native of the streams of the Pyrenees; another larger species (*M.* or *G. moschata*), very plentiful in the Volga and other rivers and lakes of the south of Russia, nearly equal in size to the common hedgehog, with tail about three-fourths of the length of

the body. The Russian desman is blackish whitish beneath; it has long silky hair, softer felt beneath, and its fur is held in esteem. Desman skins, however, are chiefly on account of the musky odour which it exhale, and which is derived from a fatty produced by small follicles under the skin of the animal. The desman feeds on leeches, larvæ, &c., searching for them in the mud with its flexible proboscis. It seldom, if ever, leaves the water, except in the inter burrows, which are sometimes twenty feet

**MUSK RAT** (*Sorex murinus*), an Indian of Shrew (q. v.), in size about equal to the brown rat, in form and colour much resembling common shrew of Britain, but remarkable powerful musky odour of a secretion which from glands on its belly and flanks. It adheres most pertinaciously to any object which the animal may come in contact, and is often utterly spoiled by it. Even and beer are said to be spoiled by it, in spite of glass and cork of the bottle; although the ability is much greater that it adheres to the of the bottle, and that the liquid is spoiled poured out. One of the Indian names of this is *Sondeli*.

**MUSK RAT.** See MUSQUASH.

**MUSKET, or MUSQUET** (Fr. *mousquet*, *mouchet*, a sparrow-hawk; in the same way other shooting-implements were named *falconet*, &c.), the firearm for infantry soldiers, succeeded the clumsy harquebuss, and in 1571 way before the Enfield rifle, which, in its turn, converted into Snider's patent breech-loading; now known as the Snider-Enfield; the latter is to be replaced by the Martini-Henry breech-loader which is being manufactured at Enfield in large quantities, and will, it is expected, be issued to the army before the end of the present year (1874). The first muskets were matchlocks; after which came wheel-locks, snaphans or snaphance muskets, and lastly, percussion muskets, which were a great improvement, both for accuracy and lightness, all which had gone before. Compared, however, to either the Enfield or Martini-Henry rifle, musket—famously known as Brown Bess (possibly a corruption of Ger. *büchse*, a hollow tube or gun)—was a heavy, ugly, and ineffective weapon. The following is a table of the ranges attained, on average, by the musket, the Enfield, and the Martini-Henry:

	Musket.	Enfield Rifle.	Martini-Henry Rifle.
Accurate fire,	750.	750.	750.
Effective against detached parties,	100	600	1200
Effective against troops in column,	150	800	1500
Effective against troops in column,	200	1000	1800

**MUSKETTOON**, an obsolete weapon, was a short musket of very wide bore, carrying a ball five ounces, and sometimes bell-mouthed like blunderbuss.

**MUSKETRY, SCHOOLS OF.** When the introduction of the Minié rifle in the French service, and the subsequent arming of the British troops with the still more delicate Enfield rifle in 1851, lowered the accuracy of a soldier's fire to be an important consideration in estimating his value (which the old musket was not the case, as it was proved that the bullet never hit the point aimed at, if ever carefully), the English government at once the necessity of providing instruction in the manipulation of the rifle. Accordingly, instructor musketry were attached to the troops, one to each regiment; and a school was established at Hythe in 1854, under the late General (then Colonel)

## MUSLIN—MUSSEL.

where lessons on the theory of the arm, and practice in its actual employment, were the sole occupation of the day. Officers and promising men were sent there as fast as the accommodation permitted; and after a course of a few weeks were able to return to their corps, and become instructors to their comrades, so that the shooting of the whole army soon rose in a surprising degree. Whereas, before the establishment of this school, the English stood low in the scale of shooting, the competitions held during recent years at Wimbledon have demonstrated that no nation can now excel them as marksmen. The formation of the volunteer corps, in 1859, led to a greatly increased demand for musketry instruction, which the government met by forming a second school of musketry at Fleetwood (now abandoned), where the troops and volunteers of Scotland, Ireland, and the northern English counties, found the necessary teaching. The Hythe school is superintended by a commandant and inspector-general of musketry instruction, with subordinate instructors. The inspector-general is responsible also for the instruction throughout the regiments all over the world, and to him the musketry returns from each regiment are sent annually.

**MUSLIN**, a cotton fabric of Oriental origin, is said to have derived its name from the town of Mosul, in Mesopotamia, where this material was at one time very largely manufactured. At present no such trade exists there; and for muslins, of the common kinds at least, the Indian market depends upon the manufactures of England and France. But no European manufacturer has ever been able to rival the wonderfully fine muslins of Dacca. This does not arise so much from the fineness of the yarn, although that too is very great, but from the marvellous fineness conjoined with a most delicate softness to the touch. The fineness of the yarn is so great, that until lately no machinery could produce anything like it; a piece of Dacca muslin, shewn in the International Exhibition (1862), was 31 feet in length by 3 feet in width, and contained in a square inch 104 warp threads and 100 weft threads, yet the entire piece weighed only 34 ounces. A French manufacturer, M. Thivel Michon of Taverne, has made a muslin of English yarn spun by the Messrs Houldsworth of Manchester, which surpassed the finest Dacca in the excessive fineness of the yarn, but it wanted its delicate softness. Muslin is much less compact in its texture than calico, indeed it more nearly resembles gauze in appearance; but it is woven plain, without any twisting of the weft threads with those of the warp. The manufacture of muslins in Great Britain and France is very extensive, especially printed muslins, in which the patterns are produced by the same processes as in calico-printing. See WEAVING.

**MUSNUD**, a Persian throne of state.

**MUSOPHAGIDÆ**. See PLANTAIN-EATER.

**MUSQUASH**, **MUSK-RAT**, or **ONDATRA** (*Fiber zibethicus*), a rodent quadruped, a native of North America. It is the only known species of the genus to which it belongs, which is characterised by dentition similar to that of the voles; in some other characters more nearly agreeing with the beaver. The M. is in shape nearly similar to the brown rat; the head and body are about 15 inches in length, the tail ten inches. The whole body is covered with a short downy dark-brown fur, intermixed with longer and coarser hairs. It is common in almost all parts of North America, from lat. 30° to lat. 69°, except in the southern alluvial districts. It is a very aquatic animal, seldom wandering from the rivers, lakes, or marshes

in which it makes its abode. The fur is in demand, and forms an article of commerce—skins in large number being still exported from America to Britain and other European countries. The M. burrows in the banks of streams and ponds; the entrances

Musquash (*Fiber zibethicus*).

of its burrows being always under water, so that it must dive to reach them. In marshes, the M. builds a kind of hut, collecting coarse grasses and mud, and raising the fabric from two to four feet above the water. The flesh of the M., at those seasons when it is fat, is in some request among the American Indians, and is said to be not unpalatable.

**MUSSEL** (*Mytilus*), a genus of lamellibranchiate molluscs, the type of the family *Mytilidæ*, which, however, is much more restricted than the Linnean genus *Mytilus*. The *Mytilidæ* belong to the division of *Lamellibranchiata*, called by Lamarck *Dimyaria*, having two adductor muscles—muscles employed in closing the valves of the shell. The mantle has a distinct anal orifice; the foot is small; and there is a large *Byssus* (q. v.), which is divided into fibres to its base. The valves of the shell are equal; the hinge is destitute of teeth. Some, but few, of the species are found in fresh-water. See DREISSENA. Some (*Lithodomus*) burrow in stone. How they do it is utterly unknown, but they do burrow even in the hardest stone; and some small tropical species excavate for themselves holes in the shells of great limpets. The *Lithodomi* are sometimes called *Date-shells*. Some of them are very beautiful, which is the case also with the true mussels, after the epidermis is removed. Even the COMMON M. (*M. edulis*) then exhibits beautiful veins of blue. This species is very abundant on the British coasts, and is much used as bait by fishermen. It is gregarious, and is found in vast beds, closely crowded, adhering by the byssus to rocks, &c. These beds are usually uncovered at low-water. The shell is oblong; at its greatest size about three inches long, and an inch and a half broad. Mussels, when young, move about by means of the foot, with which they lay hold of objects and drag themselves along, until they find some suitable spot to anchor themselves by a byssus. If detached, they soon find another anchorage. In an aquarium they readily attach their byssus-threads even to the smooth glass, and the threads may be broken more easily than separated from the glass. An ingenious and important application of the strength of these threads has been made by the French, to render Cherbourg breakwater more secure by binding the

country: if he deserted, he was only liable for breach of contract, or if he struck his officer, to an indictment for assault. The authority of the legislature thus became indispensable to the maintenance of military discipline, and parliament has, since 1689, at the beginning of every session, conferred this and other powers in an act called the Mutiny Act, limited in its duration to a year. Although it is greatly changed from the form in which it first passed, 175 years ago, the annual alterations in this act are now very slight, and substantially it has a fixed form. The preamble starts with the above quoted declaration from the Bill of Rights, and adds, that it is judged necessary by the sovereign and parliament that a force of such a number should be continued, 'for the safety of the United Kingdom, the defence of the possessions of the crown;' while it gives authority to the sovereign to enact Articles of War for the control and government of the force granted. The act comprises 107 clauses, of which the first five specify the persons liable to its provisions—viz., all enlisted soldiers or commissioned officers on full pay, and to those of the regular army, militia, or yeomanry, when employed on active service, and to recruits for the militia while under training. Clauses 6—14, treat of courts-martial, their procedure and powers. Clauses 15—28, relate to crimes and their punishment, the leading offences being mutiny, desertion, cowardice, treason, insubordination, for each of which death may be the penalty; frauds, embezzlement, &c., for which penal servitude is awarded. Clauses 29—33, provide for the government of military prisons, and for the reception of soldiers in civil jails, under the sentences of courts-martial. Clauses 34—37, enact rules to guide civil magistrates in apprehending deserters or persons suspected of desertion. Clause 38 refers to furlough; 39—41, on the privileges of soldiers, enact that officers may not be sheriffs or mayors; that no person acquitted or convicted by a civil magistrate or jury be tried by court-martial for the same offence; and that soldiers can only be taken out of the service for debts above £30, and for felony or misdemeanour. Clauses 42—59, have reference to Enlistment (q. v.); 60—74, to stoppages, billets, carriages, and ferries, providing for the compulsory conveyance and entertainment of troops by innkeepers. Clause 75 relates to the dis-

After an insignificant expedition into Africa, he set out in 707 for Maquering the kindred tribes of Eastern enrolling their warriors under his standard by 709, the whole of Northern Africa, Gothic strongholds on the coast, acknowledged the authority of the calif. At this period monarchy in Spain was in a state of confusion, and M., seizing the opportunity thus presented, sent his lieutenant Zeiad, in April 711 to make an incursion. Tarik landed at Gibraltar, marched to the banks of the Guadalete, where he met Roderic the Gothic king. In the battle that ensued, the Goths were decisively vanquished, perished in the waters of the Guadalete. The whole of Southern Spain lay at the victor's feet. M., on hearing of these success, ordered Tarik to halt for further instructions. The lieutenant, flushed with success, pushed on to the very centre of Spain, and seized the capital of the Gothic kingdom. M. immediately set out for Spain at the head of 18,000 men, took Seville, Carmona, Merida, and Cordova, and then marched upon Toledo, where he met Tarik, whom he caused to be bastinadoed, but afterwards reinstated in his rank to an order from the calif. M. then marched north-west and then east, subduing the whole of the country he went; he then crossed the Pyrenees into France, but soon after returned to Spain. he and Tarik received messages from the calif commanding their immediate presence at Damascus, he was treated with neglect, and the accession of the Calif Suleiman, who was in prison, and mulcted in 200,000 pieces of gold. M.'s two sons were deprived of their governorships of Kairwan and Tangier; and the third son governed Spain in his father's absence, while his head was sent to Muza. M. died in the greatest poverty, at Hedjaz, 717 A.D.

**MYCELIUM**, in Botany, a development of the life peculiar to *Fungi*, but apparent in all the species of that order. The sporangia or rooms is the Mycelium. The M. appears

# MYCENÆ—MYRCIA.

re been described as distinct species and to genera. Fries has rendered great service in investigating these spurious species and determining their true nature.—Liquors, the flocculent M. of a fungus is spreading, to be *motherly*.

NÆ, a very ancient city in the north-west of Argolis, in the Peloponnesus, built on a rocky height, is said to have been founded by Demetrius. It was the capital of Agamemnon's kingdom and was at that time the principal city in Greece. About 468 B.C., it was destroyed by the Persians of Argos, and never rose again from its ruins anything like its former prosperity. In 1826 its ruins only remained; these are now seen in the neighbourhood of Kharvati, specimens of Cyclopean architecture. The city is called the 'Gate of Lions,' the chief entrance to the ancient Acropolis, and receiving its name from two immense lions sculptured upon a bluish limestone above the gate. See Murray's *Tour in Greece* (vol. ii. p. 324).

MYELITIS (*myelos*, marrow) is the term employed to denote inflammation of the substance of the spinal cord. It may be either acute or chronic, but the former is by far the most common affection. The disease begins with a little uneasiness in the lower limbs, and a somewhat disordered sensation in the extremities, followed by unusual fatigue after any slight exertion. Short time paralytic symptoms appear, and increase. The gait becomes uncertain and at length the limbs fail to support the body.

The paralysis finally attacks the bladder, bowels, and the evacuations are discharged involuntarily; and death takes place as the result of asphyxia, or occasionally of asphyxia if the paralysis reaches the chest. In the acute form there is pain (especially in the spinal region), which subsides when paralysis supervenes. The symptoms are the same as those of the chronic form, but they occur more rapidly and with more severity, and death sometimes takes place in a few days.

The most common causes of this disease are falls, strains from over-exertion; but sexual excess and intemperate habits occasionally induce it, and also result from other diseases of the system, or may be propagated from inflammation of the corresponding tissue of the brain.

Treatment, which is much the same as that of paralysis elsewhere, must be confined entirely to general measures; and it is therefore unnecessary to enter into any details regarding it. When paralysis has set in, there is little to hope in the early stage the disease is often cured by judicious remedies.

MYGALÆ, a genus of spiders, the type of a

Mygale.

led *Mygalidæ*. They have four pulmonary spiracles, four spinnerets, eight eyes, and

hairy legs. They make silken nests in clefts of trees, rocks, &c., or in the ground, sometimes burrowing to a great depth, and very tortuously. To this genus belongs the bird-catching Spider (q. v.) of Surinam; but it seems now to be ascertained that several of the larger species frequently prey on small vertebrate animals. They do not take their prey by means of webs, but hunt for it and pounce upon it by surprise. They construct a silken dwelling for themselves in some sheltered retreat. Some of them make a curious lid to their nest or burrow. They envelop their eggs, which are numerous, in a kind of cocoon.

MYLABRIS, a genus of coleopterous insects, nearly allied to *Cantharis* (q. v.), and deserving of notice because of the use made of some of the species as blistering flies. *M. cichorii* is thus used in China and India; and *M. Fuesslini*, a native of the south of Europe, is supposed to have been the blistering fly of the ancients.

MYLITTA (? corresponding to Heb. *Meyaledeth*, Genitrix, who causes to bear), a female deity, apparently first worshipped among the Babylonians, who gradually spread her worship through Assyria and Persia. She is originally, like almost every other mythological deity, a cosmic symbol, and represents the female portion of the twofold principle through which all creation burst into existence, and which alone, by its united active and passive powers, upholds it. M. is to a certain degree the representative of Earth, the Mother, who conceives from the Sun, Bel or Baal. M. and Baal together are considered the type of the 'Good.' Procreation thus being the basis of M.'s office in nature, the act itself became a kind of worship to M., and was hallowed through and for her. Thus it came to pass, that every Babylonian woman had once in her life to give herself up to a stranger, and thereby considered her person consecrated to the great goddess. The sacrifice itself seems, especially in the early stage of its introduction among the divine rites of the primitive Babylonians, to have had much less of the repulsiveness, which, in the eyes of highly-cultivated nations, must be attached to it; and it was only in later days that it gave rise to the proverbial Babylonian lewdness. Herodotus's account of this subject must, like almost all his other stories, be received with great caution.

MYLODON (Gr. grinder-teeth), a genus of huge fossil sloths, whose remains are found in the Pleistocene deposits of South America, associated with the *Megatherium* and other allied genera. A complete skeleton, dug up at Buenos Ayres, measured 11 feet from the fore part of the skull to the end of the tail. Although like the modern sloth in general structure and dentition, its immense size forbids us to suppose that it could have had the same arboreal habits, and the modifications of its structure seem to have fitted it for the uprooting and prostrating of the trees, the foliage of which supplied it with food.

MYNIAS, more accurately MINYAS, was, in Greek mythology, the son of Chryses. He was king of Jolcos, and gave his name to the people called *Minyæ*. He built the city of Orchomenus, where rites (named after him) were celebrated in his honour. His three daughters Clymene, Iris, and Alcithoë, according to Ovid, but Leuconoe, Leucippe, and Alcithoë according to other authors, were changed into bats for having contemned the mysteries of Bacchus.

MYOSOTIS. See FORGET-ME-NOT.

MYRCIA, a genus of trees of the natural or *Myrtaceæ*, to which belongs the WILD CLOVE

## MYRIAPODA—MYRRH.

**WILD CINNAMON** of the West Indies (*M. acris*), a handsome tree of 20 or 30 feet high. Its timber is very hard, red, and heavy. Its leaves have an aromatic cinnamon-like smell, and an agreeable astringency, and are used in sauces. Its berries are round, and as large as peas, have an aromatic smell and taste, and are used for culinary purposes.—The leaves, berries, and flower-buds of *M. pimentoides* have a hot taste and fragrant smell, and are also used for culinary purposes.

**MYRIAPODA** (Gr. myriad-footed), a class of *Articulata*, resembling *Annelida* in their lengthened form, and in the great number of equal, or nearly equal, segments of which the body is composed; but in most of their other characters more nearly agreeing with Insects, among which they were ranked by the earlier naturalists, and still are by some. They have a distinct head, but there is no distinction of the other segments, as in insects, into thorax and abdomen. They have simple or compound eyes; a few are destitute of eyes. They have antennæ like those of insects. The mouth is furnished with a complex masticating apparatus, in some resembling that of some insects in a larval state, in others, similar to that of crustaceans. Respiration is carried on through minute pores or spiracles, placed on each side along the entire length of the body, the air being distributed by innumerable ramifying air-tubes to all parts. In most parts of their internal organisation the M. resemble insects; although a decided inferiority is exhibited, particularly in the less perfect concentration of the nervous system. The resemblance is greater to insects in their larval than in their perfect state. The body of the M. is protected by a hard *chitinous* covering. The number of segments is various, seldom fewer than 24; although in some of the higher genera they are consolidated together in pairs, so that each pair, unless closely examined, might be considered as one segment bearing two pairs of feet. The legs of some of the lower kinds, as *Julus* (q. v.), are very numerous, and may be regarded as intermediate between the bristle-like appendages which serve many annelids as organs of locomotion, and the distinctly articulated legs of insects. In the higher M., as *Scolopendra*, the legs are much fewer, and articulated like those of insects. None of the M. have wings. Some of them feed on decaying organic matter, chiefly vegetable; those of higher organisation are carnivorous. The M. do not undergo changes so great as those of insects, but emerge from the egg more similar to what they are ultimately to become; although some of them are at first quite destitute of feet; and, contrary to what takes place in insects, the body becomes more elongated as maturity is approached, the number of segments and of feet increasing.

The M. are divided into two orders: the lower, *Chilognatha* (*Julus*, &c.), having the body sub-cylindrical, the feet very numerous, the head rounded, the mandibles thick and strong; the higher, *Chilopoda* (*Scolopendra*, &c.), having the body flattened, the feet comparatively few, the head broad, the mandibles sharp and curved.

The M. are found in all parts of the world, in the ground, among moss, under stones, in the decaying bark of trees, in decaying roots, and in many similar situations. The largest species are tropical. They are all generally regarded with aversion. It is doubtful how far any of them are injurious to crops, although it is not improbable that they accelerate rotteness already begun; but some (Centipedes) have a venomous and painful bite.

**MYRICA.** See CANDLEBERRY.

**MYRISTICACEÆ.** See NUTMEG.

640

**MYRISTIC ACID** ( $C_{28}H_{48}O_8$ , HO) is a crystalline fatty acid, found in the seeds of the common nutmeg, *Myristica moschata*. It occurs in the form of a glyceride in the fat of the nutmeg, or in the butter. It has recently been found in small quantities amongst the products of the saponification of maceti, and of the fatty matter of milk; and this organic acid must be ranked amongst those which are common both to the animal and vegetable kingdoms.

**MYRMECOPHAGA.** See ANT-EATER.

**MYROBALANS**, the astringent fruit of a species of *Terminalia*, trees of the natural order *Combretaceæ*, natives of the mountains of India. The genus *Terminalia* has a deciduous bell-shaped calyx and no corolla; the fruit is a juiceless drupe. *T. Belerica*, a species with alternate elliptical leaves, on long stalks, produces great quantities of the M. of commerce; but the fruits of other species often appear under the same name. The properties are ascribed to M.; but although in great repute, they are now scarcely used in medicine. They are used, however, by tanners and dyers, and have therefore become a very considerable article of importation from India. They give a durable yellow colour with alum, and, with the addition of iron, an excellent black.—*Emblica* are the fruit of *Embellica officinalis*, of the natural order *Euphorbiaceæ*, a native of India. They are used in India as a tonic and astringent; also in tanning and in the making of ink.—There is a species of plum called the *Myrobalan Plum*. See PLUM.

**MYRRH** (Heb. *mur*), a gum resin produced by *Balsamodendron* (q. v.) *myrrha*, a tree of the natural order *Amyridaceæ*, growing in Arabia, and probably also in Abyssinia. The M. tree is small, scrubby, spiny, with whitish-gray bark, the scattered small leaves, each consisting of

Myrrh (*Balsamodendron myrrha*).

obovate obtusely toothletted leaflets, and the drupe a smooth brown ovate drupe, somewhat larger than a pea. M. exudes from the bark in the form of yellowish drops, which gradually thicken and become hard, the colour at the same time becoming darker. M. has been known and valued from most ancient times; it is mentioned as an article of commerce in Gen. xxxvii. 25, and was amongst the presents which Jacob sent to the Egyptian ruler, and amongst those which the wise men

the East brought to the infant Jesus. It was an ingredient in the 'holy anointing oil' of the Jews. *M.* appears in commerce either in tears and grains, or in pieces of irregular form and various sizes, yellow, red, or reddish brown. It is brittle, and has a waxy fracture, often exhibiting whitish veins. Its smell is balsamic, its taste aromatic and bitter. It is used in medicine as a tonic and stimulant, in disorders of the digestive organs, excessive secretions from the mucous membranes, &c., also to cleanse foul ulcers and promote their healing, and as a dentifrice, particularly in a spongy or ulcerated condition of the gums. It was much used by the ancient Egyptians in embalming. The best *M.* is known in commerce as *Turkey M.*, being brought from Turkish ports; as the name *East Indian M.* is also given to *M.* brought to Europe from the East Indies, although it is not produced there, but comes from Abyssinia. It is not yet certainly known whether the *M.* tree of Abyssinia is the same as that of Arabia, or an allied species.

**MYRSINACEÆ**, a natural order of exogenous plants, consisting of trees and shrubs, natives of warm climates, and having simple leathery leaves, destitute of stipules; hermaphrodite or unisexual flowers, generally small, but often in umbels, corymbs, or panicles; very similar in structure to the flowers of the *Primulaceæ*; the fruit generally fleshy, with 1—4 seeds. The flowers are very often marked with sunken dots or glandular lines.—There are more than 300 known species. Many of them are beautiful evergreen shrubs, particularly the genus *Ardisia*. Some have peppery fruit, as *Embellia ribes*.

**MYRTACEÆ**, a natural order of exogenous plants, consisting of trees and shrubs, natives chiefly of warm, but partly also of temperate countries. The order, as defined by the greater number of botanists, includes several suborders, which are regarded by some as distinct orders, particularly *CHAMELAIACEÆ* (in which are contained about 50 known species, mostly beautiful little bushes, often with fragrant leaves, natives of New Holland), *BARRINGTONIACEÆ* (q. v.), and *LECYTHIDACEÆ* (q. v.). Even as restricted, by the separation of these, the order contains about 1300 known species. The leaves are entire, usually with pellucid dots, and a vein running parallel to and near their margin.—Some of the species are gigantic trees, as the *Eucalypti* or *Gum Trees* of New Holland, and different species of *Metrosideros*, of which one is found as far south as Lord Auckland's Islands, in lat. 50½°. The timber is generally compact.—Astringency seems to be rather a prevalent property in the order, and the leaves or other parts of some species are used in medicine as astringents and tonics. A fragrant or pungent volatile oil is often present in considerable quantity, of which *Oil of Cajeput* and *Oil of Cloves* are examples. *Cloves* and *Pimento* are amongst the best known products of the order. The berries of several species are occasionally used as spices in the same way as the true *Pimento*. A considerable number yield pleasant edible fruits, among which are the *POMEGRANATE*, the *GUAVA*, species of the genus *Eugenia*, and some species of myrtle.

**MYRTLE** (*Myrtus*), a genus of *Myrtaceæ*, having the limb of the calyx 4—5-parted, 4—5 petals, numerous free stamens, an almost globose germen, and a 2—3-celled berry, crowned with the limb of the calyx, and containing kidney-shaped seeds. The leaves are opposite and marked with pellucid dots; the flower-stalks are axillary, and generally one-flowered. The COMMON *M.* (*M. communis*) is well known as a beautiful evergreen shrub, or a tree of

moderate size, with white flowers. It is a native of all the countries around the Mediterranean Sea, and of the temperate parts of Asia, often forming thickets, which sometimes occur even within the reach of the sea-spray. The leaves are ovate or lanceolate, varying much in breadth. They are astringent and aromatic, containing a volatile oil, and were used in medicine by the ancients as a stimulant. The berries are also aromatic, and are used in medicine in

Myrtle (*Myrtus communis*):

1, flower of Myrtle, cut vertically; 2, Myrtle in flower.

Greece and India. A *M.* wine, called *Myrtidamum*, is made in Tuscany. *M.* bark is used for tanning in many parts of the south of Europe. Among the ancient Greeks, the *M.* was sacred to Venus, as the symbol of youth and beauty, was much used in festivals, and was, as it still is, often mentioned in poetry. The *M.* endures the winters of Britain only in the mildest situations in the south.—The SMALL-LEAVED *M.* of Peru (*M. microphylla*) has red berries of the size of a pea, of a pleasant flavour and sugary sweetness. Those of the LUMA (*M. luma*) are also palatable, and are eaten in Chili; as are those of the Downy *M.* (*M. tomentosa*), on the Neilgherry Hills; and those of the WHITE-BERRIED *M.* (*M. leucocarpa*), by some regarded as a variety of the Common *M.*, in Greece and Syria. The berries of this species or variety are larger than those of the Common *M.*, and have a very pleasant taste and smell.—A very humble species of *M.* (*M. nummularia*) spreads over the ground in the Falkland Islands, as thyme does in Britain.

**MYRTLE-WAX.** See **WAX**.

**MY'SIS**, a genus of podophthalmous (stalk-eyed) crustaceans, of the order *Stomapoda*, much resembling the common shrimps in form, although differing from them in the external position of the gills. They are often called *Opossum Shrimps*, because the last two feet are furnished with an appendage, which in the female forms a large pouch, and in this the eggs are received after they leave the ovary, and are retained till the young acquire a form very similar to that of the parent, when the whole brood are at once set free into the ocean. Species of *M.* are found on the British shores, but they are far more abundant in the Arctic seas, where they form no small part of the food of whales, and of many fishes, particularly of different species of salmon.

**MYSORE**, or **MAISUR**, a raj or principality of Southern India, under the protection of the British

## MYSORE—MYSTERIES.

government, in lat.  $11^{\circ} 35' - 15^{\circ}$  N., and in long.  $74^{\circ} 45' - 78^{\circ} 45'$  E. It is bounded on the N. by the British collectorate of Dharwar, and otherwise surrounded by districts belonging to the Madras presidency. The area is 27,000 square miles; the pop. in 1871—1872 was 4,274,544. M. is an extensive table-land, with an average elevation of about 2000 feet, and with a slope principally toward the north and north-east. The chief rivers are the Cauvery, flowing south-east, and the Tungabhadra, the Hugri, and the Pennar flowing north and north-east. The climate of the higher districts is during a great portion of the year healthy and pleasant. In 1871—1872, the value of the exports, which consist of betel-nut, coffee, cotton, cardamoms, rice, silk, and sugar, amounted to £1,100,000. The imports, consisting mainly of iron, gold, pepper, salt, and pulses, were £1,070,000. Since 1832, the control of the country has been entirely in the hands of the English, and the government is administered by a British commissioner. Chief town, Mysore. For the history of M., see articles HYDER ALI, TIPPOO SAHIB, and INDIA.

**MYSORE, or MAISUR**, a city of India, the seat of a British residency, capital of the territory, and of the subdivision of the same name, is situated amid picturesque scenery on a declivity formed by two parallel ranges of elevated ground running north and south, 245 miles west-south-west of Madras, lat.  $12^{\circ} 19'$  N., long.  $76^{\circ} 42'$  E. The houses are generally built of teak, and among the chief edifices are the British residency and church. The fort is quadrangular in form, three of its sides being 450 yards in length, and the remaining side longer. The rajah's palace, occupying three sides of the interior fort, contains a magnificent chair or throne of gold. The climate is mild, but not healthy; fevers are of frequent occurrence. Carpets are manufactured. Pop. 57,765.

**MYSTAGOGUE** (Gr. *mustes*, an initiated person, and *ago*, I lead), the name in the Greek religious system of the priest whose duty it was to direct the preparations of the candidates for initiation in the several mysteries, as well as to conduct the ceremonial of initiation. It was sometimes applied by a sort of analogy to the class of professional *ciceroni*, who in ancient, as still in modern times, undertook to shew to strangers newly arrived in a city the noteworthy objects which it contained; but the former meaning is its primitive one, and formed the ground of the application of the same name in the Christian church, to the catechists or other clergy who prepared candidates for the Christian *mysteries*, or sacraments, of baptism, confirmation, and the eucharist, especially the last. In this sense, the word is constantly used by the fathers of the 4th and 5th centuries; and in the well-known lectures of St Cyril of Jerusalem, although all were addressed to candidates for the mysteries, some for baptism, and some for the eucharist, it is only to the lectures addressed to the latter that the name *mystagogic* is applied. This distinction was connected with the well-known Discipline of the Secret; and it appears to have ceased with the abolition or gradual disuse of that discipline.

**MYSTERIES** (Gr. from *muo*, to close the lips or eyes), also called *Teletai*, *Orgia*, or, in Latin, *Initia*, designate certain rites and ceremonies in ancient, chiefly Greek and Roman religions, only known to, and practised by, congregations of certain initiated men and women, at appointed seasons, and in strict seclusion. The origin, as well as the real purport of these mysteries, which take no unimportant place among the religious festivals of the classical period,

and which, in their ever-changing nature, designate various phases of religious development in the antique world, is all but unknown. It does seem, indeed, as if the vague speculations of modern times on the subject were an echo of the manifold interpretations of the various acts of the mysteries given by the priests to the inquiring disciple—according to the lights of the former or the latter. Some investigators, themselves not entirely free from certain mystic influences (like Creuzer and others), have held them to have been a kind of misty orb around a kernel of pure light, the bright rays of which were too strong for the eyes of the multitude; that, in fact, they hid under an outward garb of mummy a certain portion of the real and eternal truth of religion, the knowledge of which had been derived from some primeval, or, perhaps, the Mosaic revelation; if it could not be traced to certain (or uncertain) Egyptian, Indian, or generally Eastern sources. To this kind of hazy talk, however (which we only mention because it is still repeated every now and then), the real and thorough investigations begun by Lobeck, and still pursued by many competent scholars in our own day, have, or ought to have, put an end. There cannot be anything more alien to the whole spirit of Greek and Roman antiquity than a hiding of abstract truths and occult wisdom under rites and formulas, songs and dances; and, in fact, the mysteries were anything but exclusive, either with respect to sex, age, or rank, in point of initiation. It was only the speculative tendency of later times, when Polytheism was on the wane, that tried to symbolise and allegorise these obscure, and partly imported ceremonies, the bulk of which had undoubtedly sprung from the midst of the Pelasgian tribes themselves in prehistoric times, and which were intended to represent and to celebrate certain natural phenomena in the visible creation. There is certainly no reason to deny that some more refined minds may at a very early period have endeavoured to impart a higher sense to these wondrous performances; but these can only be considered as solitary instances. The very fact of their having to be put down in later days as public nuisances in Rome herself, speaks volumes against the occult wisdom inculcated in secret assemblies of men and women.

The mysteries, as such, consisted of purification, sacrificial offerings, processions, songs, dances, dramatic performances, and the like. The mystic formulas (*Deiknumena*, *Dromena*, *Legomena*, the latter including the Liturgies, &c.) were held deep secrets, and could only be communicated to those who had passed the last stage of preparation in the mystagogue's hand. The hold which the nightly secrecy of these meetings, together with their extraordinary worship, must naturally have taken upon minds more fresh and childlike than our advanced ages can boast of, was increased by all the mechanical contrivances of the effects of light and sound which the priests could command. Mysterious voices were heard singing, whispering, and sighing all around, lights gleamed in manifold colours from above and below, figures appeared and disappeared; the mimic, the tonic, the plastic—all the arts, in fact, were taxed to their very utmost to make these performances (the nearest approach to which, in this country, is furnished by transformation-scenes, or sensation-dramas in general) as attractive and profitable (to the priests) as could be. As far as we have any knowledge of the plots of these Mysteries as scenic representations, they generally brought the stories of the special gods or goddesses before the spectator—their births, sufferings, deaths, and resurrections. Many were the outward symbols used, of which such as the Phallus,

## MYSTERIES AND MIRACLE PLAYS.

the Thyrsus, Flower Baskets, Mystic Boxes, in connection with special deities, told more or less their own tale, although the meanings supplied by later ages, from the Neo-platonists to our own day, are various, and often very amazing. The most important Mysteries were, in historical times, those of Eleusis and the Thesmophorian, both representing—each from a different point of view—the rape of Proserpina, and Ceres's search for her: the Thesmophorian mysteries being also in a manner connected with the Dionysian worship. There were further those of Zeus of Crete—derived from a very remote period—of Bacchus himself, of Cybele, and Aphrodite—the two latter with reference to the Mystery of Propagation, but celebrated in diametrically opposed ways, the former culminating in the self-mutilation of the worshipper, the latter in prostitution. Further, the Mysteries of Orpheus, who in a certain degree was considered the founder of all mysteries. Nor were the other gods and goddesses forgotten: Hera, Minerva, Diana, Hecate, nay, foreign gods like Mithras (q.v.), and the like, had their due secret solemnities all over the classical soil, and whithersoever Greek (and partly Roman) colonists took their Lares and Penates all over the antique world. The beginning of the reaction in the minds of thinking men, against this mostly gross and degenerated kind of veneration of natural powers and instincts, is marked by the period of the Hesiodic poems; and when towards the end of the classical periods, the mysteries were no longer secret, but public orgies of the most shameless kind, their days were numbered. The most subtle metaphysicians, allegorise and symbolise as they might, failed in reviving them, and in restoring them to whatever primeval dignity there might have once been inherent in them.

MYSTERIES AND MIRACLE-PLAYS were dramas founded on the historical parts of the Old and New Testaments, and the lives of the saints, performed during the middle ages, first in churches, and afterwards in the streets on fixed or movable stages. Mysteries were properly taken from biblical and miracle-plays from legendary subjects, but this distinction in nomenclature was not always strictly adhered to. We have an extant specimen of the religious play of a date prior to the beginning of the middle ages in the *Christos Paschön*, assigned, somewhat questionably, to Gregory Nazianzen, and written in 4th c. Greek. Next come six Latin plays on subjects connected with the lives of the saints, by Roswitha, a nun of Gandersheim, in Saxony, which, though not very artistically constructed, possess considerable dramatic power and interest; they have been lately published at Paris, with a French translation. The performers were at first the clergy and choristers, afterwards any layman might participate. The earliest recorded performance of a miracle-play took place in England. Matthew Paris relates that Geoffroy, afterwards Abbot of St Albans, while a secular, exhibited at Dunstable the miracle-play of *St Catherine*, and borrowed copes from St Albans to dress his characters. This must have been at the end of the 11th or beginning of the 12th century. Fitzstephen, in his *Life of Thomas à Becket*, 1183 A.D., describes with approval the representation in London of the sufferings of the saints and miracles of the confessors. On the establishment of the Corpus Christi festival by Pope Urban IV. in 1264, miracle-plays became one of its adjuncts, and every considerable town had a fraternity for their performance. Throughout the 15th and following centuries, they continued in full force in England, and are mentioned, sometimes approvingly, sometimes disapprovingly, by contemporary writers. Designed at first as a means

of religious instruction for the people, they had long before the Reformation so far departed from their original character, as to be mixed up in many instances with buffoonery and irreverence, intentional or unintentional, and to be the means of inducing contempt rather than respect for the church and religion. Remarkable collections exist of English mysteries and miracles of the 15th c., known as the Chester, the Coventry, and the Townley plays. The first two have been published by the Shakspeare Society, and the other by the Surtees Society. The Townley mysteries are full of the burlesque element, and contain many curious illustrations of contemporary manners.

Out of the mysteries and miracle-plays sprang a third class of religious plays called *Moralities*, in which allegorical personifications of the Virtues and Vices were introduced as *dramatis personæ*. These personages at first only took part in the play along with the scriptural or legendary characters, but afterwards entirely superseded them. The oldest known English compositions of this kind are of the time of Henry VI.; they are more elaborate and less interesting than the miracle-plays. Moralities continued in fashion till the time of Elizabeth, and were the immediate precursors of the regular drama.

Miracles and mysteries were as popular in France, Germany, Spain, and Italy as in England. A piece of the kind yet extant, composed in France in the 11th c., is entitled the *Mystery of the Wise and Foolish Virgins*, and written partly in the Provençal dialect and partly in Latin. A celebrated fraternity, called the *Confrérie de la Passion*, founded in Paris in 1350, had a monopoly for the performance of mysteries and miracle-plays, which were of such a length, that the exhibition of each occupied several days. A large number of the French mysteries of the 14th c. are extant. In the alpine districts of Germany, miracle-plays were composed and acted by the peasants: these peasant-plays had less regularity in their dramatic form, were often interspersed with songs and processions; and in their union of simplicity with high-wrought feeling were most characteristic of a people in whom the religious and dramatic element are both so largely developed. In the early part of last century, they began to partake to a limited extent of the burlesque, which had brought miracle-plays into disrepute elsewhere.

It is a mistake to suppose that the hostility of the reformers was what suppressed these exhibitions. The fathers of the Reformation shewed no unfriendly feeling towards them. Luther is reported to have said that they often did more good and produced more impression than sermons. The most direct encouragement was given to them by the founders of the Swedish Protestant Church, and by the earlier Lutheran bishops, Swedish and Danish. The authorship of one drama of the kind is assigned to Grotius. In England, the greatest check they received was from the rise of the secular drama; yet they continued to be occasionally performed in the times of James I. and Charles I., and it is well known that the first sketch of Milton's *Paradise Lost* was a sacred drama, where the opening speech was Satan's Address to the Sun. A degenerate relic of the miracle-play may yet be traced in some remote districts of England, where the story of St George, the dragon, and Beelzebub, is rudely represented by the peasantry. Strange to say, it was in the Catholic south of Germany, where these miracle-plays and mysteries had preserved most of their old religious character, that the severest blow was levelled against them. Even there, they had begun to be tainted to a limited

extent with the burlesque element, which had brought them into disrepute elsewhere. In 1779, a manifesto was issued by the Prince-archbishop of Salzburg, condemning them, and prohibiting their performance, on the ground of their ludicrous mixture of the sacred and the profane, the frequent bad acting in the serious parts, the distraction of the lower orders from more edifying modes of instruction, and the scandal arising from the exposure of sacred subjects to the ridicule of freethinkers. This ecclesiastical denunciation was followed by vigorous measures on the part of the civil authorities in Austria and Bavaria. One exception was made to the general suppression. In 1633, the villagers of Oberammergau, in the Bavarian highlands, on the cessation of a plague which desolated the surrounding country, had vowed to perform every tenth year the Passion of Our Saviour, out of gratitude, and as a means of religious instruction; a vow which had ever since been regularly observed. The pleading of a deputation of Ammergau peasants with Max. Joseph of Bavaria saved their mystery from the general condemnation, on condition of everything that could offend good taste being expunged. It was then and afterwards somewhat remodelled, and is perhaps the only mystery or miracle-play which has survived to the present day. The last performance took place in 1870. The inhabitants of this secluded village, long noted for their skill in carving in wood and ivory, have a rare union of artistic cultivation with perfect simplicity. Their familiarity with sacred subjects is even beyond what is usual in the alpine part of Germany, and the spectacle seems still to be looked on with feelings much like those with which it was originally conceived. What would elsewhere appear impious, is to the alpine peasants devout and edifying. The personator of Christ considers his part an act of religious worship; he and the other principal performers are said to be selected for their holy life, and consecrated to their work with prayer. The players, about 500 in number, are exclusively the villagers, who, though they have no artistic instruction except from the parish priest, act their parts with no little dramatic power, and a delicate appreciation of character. The New Testament narrative is strictly adhered to, the only legendary addition to it being the St Veronica handkerchief. The acts alternate with *tableaux* from the Old Testament and choral odes. Many thousands of the peasantry are attracted by the spectacle from all parts of the Tyrol and Bavaria, among whom the same earnest and devout demeanour prevails as among the performers. Plays of a humbler description, from subjects in legendary or sacred history, are not unfrequently got up by the villagers around Innsbruck, which shew a certain rude dramatic talent, though not comparable to what is exhibited at Ammergau. Girls very generally represent both the male and female characters.

MYSTICISM (Gr. *mustikos*, mystical), a term used with considerable vagueness, but implying that general tendency in religion to higher and more intimate communication with the Divine, to which, in most religions, ancient and modern, certain individuals or classes have laid claim. In the Platonic philosophy, and in the Eastern systems, from which that philosophy is derived, the human soul being regarded as a portion of the divine nature, it is held to be the great end of life to free the soul from the embarrassment and mental darkness in which it is held by the material trammels of the body in which it is imprisoned. In the pursuit of this end, two very opposite courses were adopted: the first, that of spiritual purification, partly by repressing the natural appetites and weakening the sensual

impulses by corporeal austerities, partly by withdrawing the soul through intense contemplation from the outward objects of sense. The other, that of regarding the soul as a superior body, independent of its animal impulses, and deriving from its higher origin, of being affected by outward actions, or sullied by contact with the material world in which its lower nature might love to dwell. A similar element of M., which, in truth, is in some sense a constituent of every religion, is traceable in the early doctrinal history of Christianity, and the career of Christian M. also itself into the same twofold course. Among the early sects external to the church, we find first in the system of Tatian and of the Ebionites, while the second finds its parallel in the Gnostics, in Carpocrates, Bardisanes, and in the form at least of the Nicolaitic heresy. Within the Christian church there never has been a continuous manifestation of the mystical. The language of St Paul in Gal. ii. 20, and 1 Cor. xii. 2, and many expressions in the Apostles may be taken as the exponents of Christ's highest aspiration of which has ever been towards that state in which the Christian "liveth, but Christ liveth in him." And although the regular scheme of M. can be found in the Fathers, yet the writings of Hermas the Shepherd, the Epistles of St Ignatius, the works of St Cyprian of Alexandria, the Expositions of Origen, and all the Confessions of St Augustine, abound with outpourings of the true spirit of Christian mysticism. It is curious that the first systematic exposition of the principles is said to be in the works of the pseudo-Dionysius the Areopagite; but it was not till the days of the Scholastics that it received its full development, when the mystic life was resolved into three stages, viz., of Purification, of Illumination, and of Ecstatic Union with God and Absorption in Divine Contemplation. It was upon the explanation of this third stage that the great division of the medieval mystic schools mainly turned; some of them explaining the union with God in a pantheistic or semipanthistic sense, and thereby annihilating the individual will, and almost the personal existence of man in the state of ecstasy; others, with Bernard, fully preserving both the individuality and the freedom of man, even in the highest spiritual communication with his Creator. Of the latter many, as the Hesychasts (q. v.) in the Greek Church, and the Brethren of the Free Spirit (q. v.) in the West, drew from these doctrines the most revolting moral consequences; others, as Tauler, Ruysbroek, Eckhart, and others, not seem to have gone beyond the sphere of pure religion. The writings of Thomas à Kempis, St Catherine of Siena, of St John of the Cross, of St Teresa, may perhaps be taken as characteristic representations of the latter form of the traditionary M. which has descended from the mystics of the middle ages.

The later history of M. in the Roman Catholic Church will be found under the heads of MADAME GUYON, MOLINIS, and QUINTANA, the most remarkable followers of the mystical doctrines in the Protestant communion. Böhmer of Gölitz, Emmanuel Swedenborg, and the celebrated William Law (q. v.)

MYTH AND MYTHOLOGY (Gr. *mythos*), originally signified a tale, and was identical with the word *mythos* of Pindar and Herodotus, however synonymous with the Latin *mythos* and *legend*. According to the present usage, a myth is an idea or fancy presented in a form; and though, of course, any

## MYTH AND MYTHOLOGY.

in this shape might be called a myth, yet by usage the word is confined to those fictions made in the early periods of a people's existence, for the purpose of presenting their religious belief, and generally their oldest traditions, in an attractive form. The tendency to create myths in this way seems inherent in every people; certainly there is no people so sunk into the brute as to be without them. A myth is not to be confounded with an allegory; the one being an unconscious act of the popular mind at an early stage of society, the other a conscious act of the individual mind at any stage of social progress. The parables of the New Testament are allegorical; so are *Æsop's Fables*; no one mistakes them for realities; they are known to have been invented for a special didactic purpose, and so received. But the peculiarity of myths is, that they are not only conceived in the narrative form, but generally taken for real narrations by the people to whom they belong, so long at least as they do not pass a certain stage of intellectual culture. Even myths of which the allegorical significance is pretty plain, such as the well-known Greek myth of Prometheus and Epimetheus, were received as facts of early tradition by the Greeks. Myths may be divided into several classes, of which the first and most important is the theological and moral. The oldest theology of all nations is in the form of myths; hence the great importance of mythological study, now universally recognised; for it is not occupied merely or mainly with strange fancies and marvellous fictions, invented for the sake of amusement, but contains the fundamental ideas belonging to the moral and religious nature of man as they have been embodied by the imaginative faculty of the most favoured races. It is this dominance of the imagination, so characteristic of the early stages of society, which gives to myth its peculiar dramatic expression, and stamps the popular creed of all nations with the character of a poetry of nature, of man, and of God. From the very nature of the case, the myth-producing faculty exercises itself with exuberance only under the polytheistic form of religion; for there only does a sufficient number of celestial personages exist, whose attributes and actions may be exhibited in a narrative form; there is nothing, however, to prevent even a monotheistic people from exhibiting certain great ideas of their faith in a narrative form, so as by prosaic minds to be taken for literal historical facts. But besides strictly theological myths, there are physical myths, that is, fictions representing the most striking appearances and changes of external nature in the form of poetical history; in which view, the connection of legends about giants, chimeras, &c., with regions marked by peculiar volcanic phenomena, has been often remarked. It is difficult indeed, in polytheistic religions, to draw any strict line between physical and theological myths; as the divinity of all the operations of nature is the first postulate of polytheism, and every physical phenomenon becomes the manifestation of a god. Again, though it may appear a contradiction, there are historical myths; that is, marvellous legends about persons, who may with probability be supposed to have actually existed. So intermingled, indeed, is fact with fable in early times, that there must always be a kind of debatable land between plain theological myth and recognised historical fact. This land is occupied by what are called the heroic myths; that is, legends about heroes, concerning whom it may often be doubtful whether they are merely a sort of inferior, and more human-like gods, or only men of more than ordinary powers whom the popular imagination has elevated into demi-gods.

The scientific study of mythology commenced with

the ancient nations who produced it, specially with the acute and speculative Greeks. The great mass of the Greek people, indeed—of whom we have a characteristic type in the traveller Pausanias—accepted their oldest legends, in the mass, as divine and human facts; but so early as the time of Euripides, or even before his day in the case of the Sicilians, Epicharmus and Empedocles, we find that philosophers and poets had begun to identify Jove with the upper sky, Apollo with the sun, Juno with the nether atmosphere, and so forth; that is, they interpreted their mythology as a theology and poetry of nature. This, indeed, may be regarded as the prevalent view among all the more reflective and philosophical heathens (who were not, like Xenophon, orthodox believers) up from the age of Pericles, 450 B.C., to the establishment of Christianity. But there was an altogether opposite view, which arose at a later period, under less genial circumstances, and exercised no small influence both on Greek and Roman writers. This view was first prominently put forth by Euhemerus, a Messenian, in the time of the first Ptolemies, and consisted in the flat prosaic assertion, that the gods, equally with the heroes, were originally men, and all the tales about them only human facts sublimed and elevated by the imagination of pious devotees. This view seemed to derive strong support from the known stories about the birth and death of the gods, specially of Jove in Crete; and the growing sceptical tendencies of the scientific school at Alexandria, were of course favourable to the promulgation of such views. The work of Euhemerus accordingly obtained a wide circulation; and having been translated into Latin, went to nourish that crass form of religious scepticism which was one of the most notable symptoms of the decline of Roman genius at the time of the emperors. Historians, like Diodorus, gladly adopted an interpretation of the popular mythology which promised to swell their stores of reliable material; the myths accordingly were coolly emptied of the poetic soul which inspired them, and the early traditions of the heroic ages were set forth as plain history, with a grave sobriety equally opposed to sound criticism, natural piety, and good taste.

In modern times, the Greek mythology has again formed the basis of much speculation on the character of myths and the general laws of mythical interpretation. The first tendency of modern Christian scholars, following the track long before taken by the fathers, was to refer all Greek mythology to a corruption of Old Testament doctrine and history. Of this system of interpreting myths, we have examples in Vossius, in the learned and fanciful works of Bryant and Faber, and very recently, though with more pious and poetic feeling, in Gladstone. But the Germans, who have taken the lead here, as in other regions of combined research and speculation, have long ago given up this ground as untenable, and have introduced the rational method of interpreting every system of myths, in the first place, according to the peculiar laws traceable in its own genius and growth. Ground was broken in this department by Heyne, whose views have been tested, corrected, and enlarged by a great number of learned, ingenious, and philosophical writers among his own countrymen, specially by Buttmann, Voss, Creuzer, Müller, Welcker, Gerhard, and Preller. The general tendency of the Germans is to start—as Wordsworth does in his *Excursion*, book iv.—from the position of a devout imaginative contemplation of nature, in which the myths originated, and to trace the working out of those ideas, in different places and at different times, with the most critical research, and the most vivid reconstruction. If in

this work they have given birth to a large mass of ingenious nonsense and brilliant guess-work, there has not been wanting among them abundance of sober judgment and sound sense to counteract such extravagances. It may be noticed however, as characteristic of their over-speculative intellect, that they have a tendency to bring the sway of theological and physical symbols down into a region of what appears to be plain historical fact; so that Achilles becomes a water-god, Peleus a mud-god, and the whole of the *Iliad*, according to Forchhammer, a poetical geology of Thessaly and the Troad! Going to the opposite extreme from Euhemerus, they have denied the existence even of deified heroes; all the heroes of Greek tradition, according to Uschold, are only degraded gods; and generally in German writers, a preference of transcendental to simple and obvious explanations of myths is noticeable. Creuzer, some of whose views had been anticipated by Blackwell, in Scotland, is especially remarkable for the high ground of religious and philosophical conception on which he has placed the interpretation of myths; and he was also the first who directed attention to the oriental element in Greek mythology—not, indeed, with sufficient discrimination in many cases, but to the great enrichment of mythological material, and the enlargement of philosophical survey. In the most

recent times, by uniting the excursive method of Creuzer with the correction supplied by the critical method of O. Müller and his successors, the science of comparative mythology has been brought into existence; and specially the comparison of the earliest Greek mythology with the sacred legends of the Hindus, has been ably advocated by Max Müller in the *Oxford Essays* (1856). In France, the views of Euhemerus were propounded by Banier, and generally the French scholars, such as Rochette and Petit Radet shew a distinct tendency to recognise as much of the historical element as possible in mythology. By the German scholars, mythology is a field that has been scantily cultivated. Besides those already mentioned, Payne Knight, Mackay, Grote in the first of his history, and Keightley are the only English writers of any note, and their works can in no wise be distinguished by originality, extent of research, invidious criticism, or in largeness of view, from the productions of the German school. The common purposes is Keightley; the most original is Payne Knight. On the special mythologies of Rome, Greece, &c., information will be found under the heads of the respective countries to which they belong. The more important mythological characters are noticed under their own names: BACCHUS, JUPITER, HERCULES, &c.

# N

**N** THE fourteenth letter of the English alphabet, is one of the nasal liquids of the lingual class. See **LETTERS**. Its Hebrew (and Phœnician) name, *Nun*, signified a fish, which its original form was probably meant to represent. N is interchangeable with L (q. v.) and M, as in *collect*, *commingle*, *confer*; and in Ger. *boden*, compared with Eng. *bottom*.

In Latin, this letter had a faint, uncertain at the end of words and in some other positions especially before *s*. This accounts for words in which the *n* in the nominative case, though not in the oblique cases, as *homo*, *hominis*; or Greek names like *Platon* being written with the final *n* in Latin. The dull, muffled pronunciation of *n*, which is indicated by such as *consul*, *censor*, *testamento*, being frequently *cosul*, *cesor*, *testameto*, was the first stage of modern French nasal *n*. Before a guttural *n* naturally assumes the sound of *ng*, as *bank*.

**NAS**, a market and assize town of Kildare co., Ireland, 20½ miles south-west of Dublin, next to Athy, the largest town in the county. Population in 1871 was 3660. The principal street is about half a mile in length; the county house is in the main street. Having been the seat of the kings of Leinster, N. was occupied by the English. A parliament was held there in 1419, and it obtained charters successively from Henry V., Elizabeth, and James I. At present, N. is a place of little trade, and is almost wholly without manufactures. It returned two members to the Irish parliament, but was disfranchised at the Union. It is the seat of a diocesan school, and of three national schools, one of which is attached to the Roman Catholic convent. Two newspapers, printed at Maryborough, are also sent here.

**BOB**, or **NABAB**, a corruption of the word *deputy*, was the title belonging to the governors, under the Mogul empire, of the provinces into which the district of a *dar* (q. v.) was divided. The title was conferred under the British rule, but it gradually came to be applied generally to natives who were men of rank and consideration. In Europe, and especially in Britain, it is applied derisively to those who, having made great fortunes in the Indies, return to their native country, where they live in oriental luxury.

**BO NA'SSAR**, ERA OF, was the starting-point of the Babylonian chronology, and was adopted by the historians of Alexandria, Berossus and others. It began with the accession of Nabonassar to the throne—an event calculated (from certain astronomical phenomena recorded by Ptolemy) to have taken place on February 747 B. C.

**BULUS**, or **NABULUS** (a corruption of the Greek *Βελλούσιον*), New City, the name given to it in the reign

of Vespasian), anciently called **SHECHEM** or **SICHEM**, in the New Testament (John iv. 5), **SYCHAR**; is a town of Palestine, possessing, it is said, 'the only beautiful site from Dan to Beersheba.' It lies between Mount Ebal and Mount Gerizim, on the south side of the valley of Erd-Mûkhna, and has a population variously estimated at from 8000 to 14,000, of whom about 500 are Christians, 150 Samaritans, and 50 Jews; the rest are Mohammedans, fierce, turbulent, and fanatical. The houses are pretty good, but the streets (as usual in the East) are narrow, gloomy, and filthy. The chief productions are soap, cotton, and oil—the soap-manufactories are large, and the oil is considered the best in Syria.—See *Porter's Handbook for Syria and Palestine*, and *Stanley's Palestine*.

**NACRE**. See **MOTHER OF PEARL**.

**NADIR**, an Arabic word signifying that point in the heavens which is diametrically opposite to the zenith, so that the zenith, nadir, and centre of the earth are in one straight line. The zenith and nadir form the poles of the Horizon (q. v.). See **ZENITH**.

**NADIR SHAH**, of Persia, belonged to the Afshars, a Turkish tribe, and was born near Kelat, in the centre of Khorassan, Persia, in 1688. When 17 years old, he was taken prisoner by the Usbeks, but escaped after four years of captivity; entered the service of the governor of Khorassan, and soon obtained high promotion. Having, however, been degraded and punished for some real or supposed offence, he betook himself to a lawless life, and for several years was the daring leader of a band of 3000 robbers, who levied contributions from almost the whole of Khorassan. An opportunity having occurred, N. seized the town of Kelat, and gradually extended his territorial authority. Persia was at this time ruled by Melek Ashraf, an Afghan of the tribe of Ghilji, whose grinding tyranny and cruelty produced in the mind of every Persian a deadly hatred of the very name Afghan, which exists to the present day. N. having avowed his intention of expelling the hated race from the country, and restoring the Saffavid dynasty, numbers flocked to his standard, and Meshed, Herat, and all Khorassan were speedily reduced. Ashraf, signally defeated in several engagements, fled before the avenger, who, with a celerity only equalled by its thoroughness, purged the provinces of Irak, Fars, and Kerman of even the semblance of Afghan domination. The assassination of Ashraf, during his retreat, terminated the war. The rightful heir, Tamasp, then ascended the throne, and N. received for his services the government of the provinces of Khorassan, Mazanderan, Seistan, and Kerman, assuming at the same time the title of Tamasp-kûli (the Slave of Tamasp), the title of khan being subsequently added. He was sent against the Turks in 1731, and defeated them at Hamadan, regaining the Armenian provinces which had been seized by the Turks in the preceding reign; but

his sovereign having in his absence engaged unsuccessfully the same enemy, N. caused him to be put in prison, and elevated his infant son, Abbas III., to the throne in 1732. The death of this puppet, in 1736, opened the way for the elevation of N. himself, who was crowned as *Nadir Shah*, February 26, 1736. He resumed the war with the Turks; and though totally defeated in the first two battles by the Grand Vizier Asman, turned the tide of fortune in the subsequent campaign, and granted peace to the Turks on condition of receiving Georgia. He also conquered Afghanistan, and drove back the invading Usbeks. His ambassador to the Great Mogul having been murdered along with all his suite at Jelalabad, and satisfaction having been refused, N. in revenge ravaged the North-west Provinces, and took Delhi, which he was, by the insane behaviour of the inhabitants, reduced to the necessity of pillaging. With booty to the amount of £20,000,000, including the Koh-i-nûr (q.v.) diamond, he returned to the west bank of the Indus. He next reduced Bokhara and Khaurezm, restoring to Persia her limits under the golden reign of the Sassanides. From this period, his character underwent a sudden change: he was formerly open-hearted, liberal, and tolerant; he now became suspicious, avaricious, and tyrannical. The empire groaned under his extortions, and he was finally assassinated on the 20th June 1747. His only surviving son was carried to Constantinople, and thence to Vienna, where he was brought up as a Catholic, under the surveillance of the Empress Maria Theresa, and died a major in the Austrian service, under the title of Baron Semlin. N.'s tyranny has now been forgotten; and at the present day, he is regarded with pride and gratitude as the 'Wallace' of Persia.

NÆVIUS, CN., one of the earliest Latin poets, was born, probably in Campania, in the first half of the 3d c. B.C. In his youth, he served in the first Punic war; but about the year 235 B.C., he made his appearance at Rome as a dramatic writer. Of his life, we know little; but of his character, rather more. He was very decidedly attached to the plebeian party; and in his plays, satirised and lampooned the Roman nobles with all the virulence and indiscretion of a hot-blooded impetuous Campanian—that Gascon of ancient Italy! His rashness ultimately caused his banishment to Utica in Africa, where he died, 204 or 202 B.C. Besides his dramatic writings, comprising both tragedies and comedies, he wrote an epic poem, *De Bello Punico*, in the old Saturnian metre. Of these, only a few very unimportant fragments are extant, which may be found in Bothe's *Poetarum Latinorum Scenicarum Fragmenta* (Halberstadt, 1824); or Klunmann's collection of the same (Jena, 1843), enriched by a life of N., and an essay on his poetry. See also Sellars's *Poets of the Roman Republic* (Edin. 1863).

NÆVUS (known popularly as *mother-spot* or *mole*) is a congenital mark or growth on a part of the skin. Sometimes it is merely a dark discoloration of the surface as described in the article MACULÆ, in which case it is termed a mole and is perfectly harmless; but often it consists of a dense network of dilated blood-vessels, forming a reddish or livid tumour, more or less elevated above the surface of the surrounding skin. The most frequent situations of these vascular nævi are the skin and subcutaneous cellular tissue of the head; but they may occur elsewhere. The popular belief is, that they are caused by the longing of the mother during her pregnancy for a lobster, or strawberry or raspberry, or some other red-coloured article of food, and that the influence of her mind has impressed upon the

fœtus a more or less vivid image of the thing so longed for; and hence the name of *mother-spot*. Sometimes these tumours waste away spontaneously, and give no trouble; but frequently they increase rapidly, invade the adjacent tissues, and ulcerate or slough, and thus become dangerous to life by hæmorrhage. When these tumours do not show a tendency to increase, no treatment is necessary. When they are obviously increasing in size, continual application of cold (by means of ice-mixtures), with moderately firm pressure, is sometimes of service; but a more certain method is to employ means to produce such an amount of inflammation as to obliterate the vessels; for this purpose, the seton, the application of nitric acid, or vaccination of the tumour, have been successfully applied. The injection of strong astringents, with the view of coagulating the blood, has sometimes effected a cure. If all those means fail, amputation, either with the ligature or knife, may be resorted to; the ligature being regarded as the safest and best method. For the various methods of applying the ligature, the reader is referred to any standard work on operative surgery. If the tumour is in an inaccessible spot, as in the orbit, the eye, and is increasing rapidly, the only course is to tie the large vascular trunk supplying it. The common carotid artery has in several instances been tied with success for vascular nævus in the orbit.

NÄFELS, a village of Switzerland, in the canton of Glarus, and five miles north of the town of that name, in a deep valley, is one of the most famous battle-fields in the country. Pop. (1870) 200. Here, in 1388, 1500 men of Glarus, under Matthias am Buhl, overthrew an Austrian force of from 6000 to 8000 men. The event is still celebrated yearly.

NĀGA is, in Hindu Mythology, the name of deified serpents, which are represented as the sons of the Muni Kasyapa and his wife Kadri, whom they are also called Kādraveyas. Their king is Śesha, the sacred serpent of Vishṇu.

NĀGAPATNAM, a seaport of British India on the Coromandel coast, in the province of Tanjore, 15 miles south of Karikal. It was taken by the Dutch in 1660, but fell into the hands of the English in 1781. Its site is an open sandy plain, elevated only three or four feet above sea-level. The port is visited by small vessels, and carries on some trade with Ceylon. Pop. 10,000, many of whom are of Dutch descent.

NĀGĀRJUNA, or NĀGASENA, is the name of one of the most celebrated Buddhist teachers or patriarchs—the thirteenth—who, according to some, lived about 400 years, according to others, about 500 years, after the death of the Buddha Śākyamuni (i. e., 143 or 43 B.C.). He was the founder of the Mādhyamika school, and his principal disciples were Aryadeva and Buddhapaṇḍita. According to the tradition of the Buddhists, he was born in the south of India, in a Brahmanical family. Even as a child, he studied all the four Vedas; later, he travelled through various countries, and became proficient in astronomy, geography, and magical arts. By means of the last, he had several amazing adventures, which ended in the death of three companions of his, but in his own repentance, and with the assistance of a Buddhist mendicant, in his conversion to Buddhism. Many miracles are, of course, attributed to his career as propagator of this doctrine, especially in the south of India, and his life is said to have lasted 300 years.—See E. Burnouf, *Introduction à l'Histoire du Bouddhisme Indien* (Paris, 1844); Spence Hardy, *A Manual of Buddhism* (Lond. 1853); W. Wassiljew, *Der*

# NAGASAKI—NAGY ENYED.

*hisimus, seine Dogmen, Geschichte und Literatur* Petersburg, 1860).

**NAGASAKI**, or **NANGASIKI**, a city and port of Japan, opened to foreign commerce by the treaty of 1854, on the 1st July 1859, is situated in 32° 44' N. and 129° 51' E. long., on the western side of a peninsula in the north-west of the island of Kiusiu. Previously to 1859, it was the only port in Japan open to foreigners. The harbour, which is one of the most beautiful in the world, is about six miles in breadth, and three or four in length. To a person standing on the shore, it appears completely land-locked, and it is surrounded by hills of about 1500 feet in height. The hills are broken into long ridges and deep valleys; the more fertile spots are terraced and under cultivation. The town of N., which is about a mile in length, and three-quarters of a mile in width, lies on the north side of the bay; its population is estimated at 70,000. The streets in general are clean and paved, but the houses are not particularly good, except those possessed by courtesans, and known as 'houses.' On the hills behind the town are many temples, those dedicated to 'Sinto,' or the worship of the sun goddess, which is the old national religion of Japan, and those in which the Buddhist religion, imported from China, is followed. The foreign settlement lies to the south of the native town, the British, French, German, Prussian, and American consulates occupying the hilly ground overlooking the bay. On the opposite side of the bay the Japanese have a steam-factory, under the supervision of Dutch officers, and close by is the foreign settlement. The climate of N. is genial and variable. The trade of N. is inferior to that of Yokohama. Sea-weed, salt-fish, and other articles are exported to China. The exports to Europe are chiefly tea, tobacco, coal, ginseng, vegetable wax, copper. The chief imports are cotton pieces, woollen goods, sugar, oils. The total value of exports in 1871 amounted to 1,634,610 dollars, and the imports to 2,524,203 dollars. The import duties (according to the Consular Report of 1871) from the very confined outlet of this market, in the absence of wealthy native merchants, and of all banking facilities, both foreign and native, are levied at Hiogo, Osaka, and Yokohama.

**AGELFLUE**, the provincial name for a bed of conglomerate belonging to the Mollasse (q. v.), which forms a considerable portion of the strata in the central region of Switzerland, between the Alps and the Jura. It is said to attain the enormous thickness of 6000 and 8000 feet in the Rhigi near Lucerne, and in the Speer near Wesen.

**AGKESUR**, the name under which the blossoms of the *Mesua ferrea* are sold in the bazaars of India. See **GUTTIFERÆ**.

**AGPUR**, a city of British India, capital of the province of the same name, and situated near the north-west extremity, in an unhealthy swampy low, 430 miles in a direct line east-north-east of Bombay. Inclusive of its extensive suburbs, it is 15 miles in circumference. It contains no important edifices. The great body of the inhabitants live in thatched mud-tents, interspersed with huts, which prevent the circulation of air, and the moisture, thus rendering the town unhealthy. The mean temperature of N. is estimated at about 80° F. Cotton cloths, coarse line chintzes, turbans, silks, brocades, blankets, tents, tent-cloths, and articles in copper and iron, are manufactured. Here, on the 26th and 27th November 1817, a small British force of 1350 men, commanded by Colonel Scott, defeated a native force of 18,000 men. Pop. (1872) 85,661.

**NÁGPUR**, an extensive inland province of British India, belonging in its civil administration to the Bengal, and in its military to the Madras Presidency, extends immediately north-east of the Nizam's Dominions, in lat. 17° 15'—23° 5' N.; long. 78° 3'—83° 10'. Area, 76,432 square miles; pop. 4,650,000. The north part of the province is mountainous in character, being traversed by spurs of the great Vindhya range; the general slope of the surface is from north-west to south-east, and the Bay of Bengal receives the drainage of the country chiefly through the rivers Máhanadi and Wain Gangá—the latter a tributary of the Godávari. The climate is not healthy, and is especially insalubrious in the extensive tracts of low marshy land which abound in the province. The Gonds (see **INDIA**), supposed to be the aborigines, are the most remarkable class of the inhabitants. They rear fowls, swine, and buffaloes; but their country, forming the south-eastern tracts—about one-third of the whole—is covered with a dense jungle, swarming with tigers. In the more favoured districts, where the inhabitants are more industrious, rice, maize, oil, and other seeds, and vegetables are extensively cultivated. The rajahs of N., sometimes called the rajahs of Berar, ruled over a state formed out of a part of the great Mahratta kingdom. The dynasty, however, died out in 1853, and the territory came into the possession of the British. The province has five divisions—capital, Nagpur.

**NAG'S HEAD CONSECRATION**. This story, which was first circulated by the Roman Catholics forty years after the event, with respect to Archbishop Parker's consecration, was to the following effect. On the passing of the first Act of Uniformity in the first year of Queen Elizabeth, fourteen bishops vacated their sees, and all the other sees excepting that of Llandaff being vacant, there was a difficulty in maintaining the hitherto unbroken succession of bishops from apostolical times. Kitchin of Llandaff refused to officiate at Parker's consecration, and consequently the Protestant divines procured the help of Scory, a deprived bishop of the reign of Edward VI., and all having met at the Nag's Head Tavern in Cheapside, they knelt before Scory, who laid a Bible on their heads or shoulders, saying: 'Take thou authority to preach the word of God sincerely;' and they rose up bishops of the New Church of England! The story is discredited by the Roman Catholic historian Lingard, and is carefully refuted by Strype in his life of Parker. The facts of the case are, that the election took place in the chapter-house at Canterbury, the confirmation at St Mary le Bow's Church in Cheapside, and the consecration in the chapel of Lambeth Palace. Scory, then elected to the see of Hereford; Barlow, formerly Bishop of Wells, then elected to Chichester; Coverdale, formerly of Exeter, and never reappointed to any see; and Hodgkin, suffragan of Hereford, officiated at the consecration. The Nag's Head story probably arose from the company having possibly gone from Bow Church, after the confirmation, to take a dinner together at the tavern hard by, according to the prevailing custom. The due succession of bishops in the English Church has never been broken.

**NAGY**, a Hungarian word, meaning 'great.' It is prefixed to the names of many towns in Hungary and Transylvania. In the present work, many of the towns that take this prefix are given under the name that comes after it.

**NAGY BANYA**. See **BANYA**.

**NAGY ENYED**, a small town of Transylvania, on the Maros, 17 miles north-north-east of Karlsburg.

It contains a famous Calvinistic college. Pop. 5779.

**NA'HUM**, one of the twelve minor prophets, was a native either of Elkosh, in Galilee, or the son of a man named Elkosh. The identification of his birthplace with Capernaum (Nahum's Village) or a place called Elkosh, on the east side of the Tigris, not far from Nineveh, is the result of vague speculation. He was probably a contemporary of Isaiah, and flourished about 713—711 B.C. The burden of his 'vision' (in 3d chap.) is the destruction of Nineveh and the downfall of the Assyrian kingdom. His style is full of animation, fancy, and originality, and at the same time clear and rounded. His language throughout is classical, and in the purest Hebrew, belonging to the second half of Hezekiah's reign, or to the time immediately following the defeat of Sennacherib before Jerusalem (2 Kings xix. 35, &c.). A commentary on N., with special reference to the Assyrian monuments lately discovered, has been written by O. Strauss (Berlin, 1853).

**NA'IA**. See **ASP** and **COBRA**.

**NA'IADES**, **NAIADA'CEÆ**, or **POTAMEÆ**, a natural order of endogenous plants, divided by some botanists into several orders (*Juncagineæ*, *Zosteraceæ*, &c.), containing in all not quite 100 known species, all aquatic plants, some of them inhabiting the ocean, some found in lakes and ponds, some in streams. They are all of very cellular structure; the leaves have parallel veins, and the flowers are inconspicuous. To this order belongs the Pondweed (*Potamogeton*), of which a number of species abound in the still waters of Britain, and of which some are found as far north as Iceland. To this order also belongs the GRASSWRACK (q. v.) of our shores, used for stuffing mattresses. The Lattice-leaf (q. v.) of Madagascar is one of the most interesting species, and one of the few which attract notice as in any way beautiful.

**NA'IADES**, in Grecian Mythology, the nymphs of fresh-water lakes, rivers, and fountains. They were believed to possess the power of inspiration; hence, soothsayers and others are sometimes called *nympholeptoi* (seized by the nymph). They were represented as half-clothed maidens, and not unfrequently as companions of Pan, of Hercules, the patron of warm springs, or of the Sileni and the Satyrs, in whose jovial dances they join.

Naiant.

**NA'IADES**, or **NA'TANT** (Lat. *natare*, to swim), a heraldic term applied to a fish when borne horizontally across the shield in a swimming position.

**NAIGUE**, or **NAIK**, a native subaltern officer among Indian and Anglo-Asiatic troops, whose functions are somewhat analogous to those performed among European troops by the drill-sergeant.

**NAILS** are flattened, elastic, horny plates, which are placed as protective coverings on the dorsal surface of the terminal phalanges of the fingers and toes. Each nail consists of a *root*, or part concealed within a fold of the skin; a *body*, or exposed part attached to the surface of the skin; and a free anterior extremity called the *edge*. The skin below the root and body of the nail is termed the *matrix*, from its being the part from which the nail is produced. This is thick, and covered with highly vascular papillæ, and its colour is seen through the transparent horny tissue. Near the root, the papillæ are smaller and less vascular; hence

the portion of nail corresponding to this part is whiter colour; from its form, this portion is termed the *lunula*. It is by the successive growth of cells at the root and under the body of the nail it advances forwards, and maintains a due thickness whilst at the same time its growth in a particular direction is insured. The chemical composition of the nails is given in the article **HORN**. There are two classes of structures they belong. According to the observation of Beau, the finger-nails grow at the rate of about two-fifths of a line in a day, while the toe-nails only grow with about one-fifth of that rapidity. When a nail has been removed by violence, or has been thrown off in consequence of the formation of matter (pus) beneath it, a new nail is speedily formed, provided the matrix has not been seriously injured.

There is a very common and troublesome affection popularly known as *ingrowing nail*. Its most frequent seat is by the side of the great toe. It does not in reality arise from any alteration of the nail, but from the adjacent soft parts being constantly pressed by the use of tight shoes against its edge. The parts become swollen and inflamed; suppuration ensues, and an intensely sensitive ulcer is formed in which the nail is embedded. Surgical assistance should at once be resorted to in these cases, as there is no probability that the ulcer will heal spontaneously, especially if the patient continues to wear about, and thus keep up irritation. In obstinate cases, it is not unfrequently necessary to remove a portion of the nail, an operation attended with much pain, although quickly performed.

**NAILS**, pointed pieces of metal, usually flattened or rounded heads, used for driving into wood-work, for the purpose of holding the parts together. A variety, in which the head is very large, and the spike portion small, used by shoemakers for protecting the soles of boots and shoes from wear, is called the *hob-nail*; another, which is made by cutting thin plate-iron into thin pointed pieces of various lengths, is called *brads*; these are sometimes without heads, but are usually made with a slight projection by way of a head. When made small, with flat heads, for attaching drapery or hangings in upholstery-work, they are called *tacks*; and when very large for heavy carpenter's work, they are called *spikes*.

**Nail-making**.—Formerly, all nails were made, by forging on an anvil; and in Britain and the north of Europe, vast quantities are made in this manner, being preferable, for many kinds of carpenters' work, to those made by machinery. In France, the greater part of the nails used for light carpentry-work are made of soft iron wire, pointed with the hammer; and in order to head them, they are pinched in a toothed vice, which leaves the portion for the head projecting and makes below it three or four grooves in the nail, which increase its hold on the wood when driven home. The head is beaten into a cone, sinking on the vice, which regulates the size.

The iron used for hand nail-making in Britain is sold in bundles, and is called *nail-rod*; it is either prepared by rolling the malleable iron into rods or small bars of the required thickness—the process is only employed for very fine qualities, by cutting plate-iron into strips by means of rolling shears: these shears consist of two powerful revolving shafts (*a, a*, fig.), upon which are fixed discs of steel with squared edges (*b, b*, fig.). The discs of one shaft alternate with those of the other; they are so placed, that a small portion of one set of discs are inserted between those of the other. When the shafts are revolving, a plate of iron

# NAIN DE TILLEMONT—NALA.

sed between the discs in the plane of the dotted c, c, fig.; and it is forcibly drawn through, steel discs cutting the plates into strips with

rapidity. The quantity produced in this way enormous, some mills turning out at the rate of miles per hour of nail-rods. Several inventions, in which America took the have been introduced, and are successfully ed, for making nails direct from plate-iron, r by cutting them out cold or hot; and a very proportion of the nails in use are made in way. Nail-making by machinery was origi- in Massachusetts in 1810.

AIN DE TILLEMONT. See TILLEMONT.

IRN, in the county of the same name, is a , parliamentary, and municipal burgh, and is les north-east by rail from Inverness. It is ed at the mouth of the river Nairn, on the side, and for that reason was anciently called -nairn. Lying on the southern shore of the y Firth, which is here about eight miles s, it commands a grand and extensive view e coast of Ross-shire, including Cromarty Bay, y opposite. N. was regalsied by William the

It has little historical interest, and few ts worthy of antiquarian attention. It is ipally remarkable for the excellence of its athing and artificial baths, in which respect it al, if not superior, to any town in the north of and, as a resort in summer. The temperature ld and equable. The inhabitants enjoy a rkable immunity from epidemic diseases. s is a commodious harbour. The town has a ry society, a museum, a newspaper, three h banks, and a savings bank. It is conspicu- for good and cheap education. Pop. in 1871, N. unites with Inverness, Forbes, and Fort- n sending a member to parliament.

IRNSHIRE is bounded on the N. by the y Firth, and on its other sides by the counties erness and Moray, of the latter of which it ntly formed a part. It extends north and 22 miles, and 15 miles from east to west. rea is 215 square miles, or 137,500 acres, of about 24,000 are under cultivation. Pop. in 10,225, including the burgh of Nairn. Along Elginshire, it returns one member to parliament. itency (1873—1874), 451; rental, £32,544. s is the only royal burgh in the county, but are the villages of Cawdor and Auldearn. The for the most part light and sandy. There is, ver, considerable agricultural activity, though the y is perhaps better known for its cattle-breeding. portant cattle 'tryst' is held at Cawdor once th during the greater part of the year. The

climate of this county is distinguished for its salu- brity, and the temperature is remarkably equable. The thermometer in the shade has not risen above 78° 3', or fallen below 11° 2', during the last twenty years. According to the latest observations, the yearly rainfall did not amount to more than 26 inches, the greatest fall being in October, and the least in April. At Brackla Distillery, which belongs to Robert Fraser, Esq., from 40,000 to 50,000 gallons of spirits are manufactured annually. The river Nairn runs through the county in a beau- tiful valley, which presents particularly attrac- tive and romantic scenery in the neighbourhood of Cawdor Castle, one of the residences of the Earl of Cawdor. This castle is of uncertain antiquity, and is in an excellent state of preservation. It was the residence of the ancient Thanes of Cawdor, one of whom is mentioned in *Macbeth*. About the year 1510, the estates belonging to the earldom passed by marriage from the old family of Calder into the hands of a son of the Duke of Argyle, and are still in the possession of his descen- dants. Not a few other objects of antiquarian interest are to be found in the county of Nairn.

NAISSANT, a term applied in heraldic blazon to an animal depicted as coming forth out of the middle—not like *Issuant* or *Jessant* (q.v.), out of the boundary line—of an ordinary.

NAKHICHEVA'N, ON THE DON, a thriving town of South Russia, in the government of Ekaterinoslav, on the right bank of the Don, and near the mouth of that river, two miles east of Rostov. It was founded in 1779 by Armenian settlers from the Crimea, and has 16,584 inhabitants, mostly Arme- nians, belonging to the Greek-Armenian Church. There are several factories, chiefly for the manu- facture of woollen goods, and an extensive trade is carried on.

NAKSHATRA (a Sanscrit word of doubtful etymology, but probably a compound of an obsolete base *naksha*, night, and *tra*, protecting, i. e., literally night-protecting) means properly star, and is used in this sense in the Vedas. At a later period, it was applied to the asterisms lying in the moon's path, or to the mansions in which the moon is supposed to rest in her, or rather, according to Hindu notions, *his* path. The number of these asterisms was reckoned originally at 27, later at 28; and mythology transformed them into as many daughters of the patriarch Daksha, who became the wives of the moon. See MOON. Biot, the distinguished French astronomer, endeavoured to shew that the Hindu system of the Nakshatras was derived from the Chinese *sien*; but his theory, though supported by very learned arguments, has been refuted by Pro- fessor Whitney, in his notes to Burgess's translation of the *Sūrya-Siddhānta* (New Haven, United States, 1860), and by Professor Müller in his preface to the 4th volume of the *Rig-Veda* (Lond. 1862); for their arguments leave little doubt that the system of the Nakshatras originated from the Hindu mind.

NALA is a legendary king of ancient India—a king of Nishadha—whose love for Damayanti, the daughter of Bhīma, king of Vidarbha, and the adventures arising from, or connected with, it—the loss of his kingdom, the abandonment of his wife and children, and their ultimate restoration—have supplied several Hindu poets with the subject of their muse. The oldest poem relating to Nala and Damayanti is a celebrated episode of the *Mahābhārata* (q.v.), edited both in India and Europe, and translated

Naissant.

in Latin by Bopp; in German by Kosegarten, Bopp, Rückert, and Meier; and in English by Dean Milman. The two other renowned poems treating of the same legend, but with far less completeness, are the *Nalodaya* (q. v.) and the *Naishadhacharita* of Śrī-Harsha.

NALODAYA is the name of a Sanscrit poem which is highly prized by the modern Hindus. Its subject is the story of Nala (q. v.), but more concisely narrated than in the episode of the *Mahābhārata*, whence its contents are borrowed; and its reputed author is Kālidāsa (q. v.). Great doubts, however, must attach to the attribution of this authorship, if by Kālidāsa the author of *Śākuntala* is meant, and not some other poet bearing the same name; for the merits of this poem consist neither in elevation of thought nor in richness of fiction: they are sought for by the Hindus in its elaborate and artificial diction, and in its alliteration of every variety, which, to a European mind of culture and taste, would be no more than an intolerable jingle of sounds, devoid of all poetical worth. The text of the poem, with a modern commentary, has been edited (Berlin, 1830) by F. Benary, and (Calcutta, 1844) by W. Yates, who added to his edition a free metrical translation of the text, and an essay on Sanscrit Alliteration.

NAMA'QUALAND, GREAT. The extensive region in South Africa north of the Cape Colony, extending from the Orange River, lat. 29° 30', to Walfish Bay, lat. 23°, and stretching inland from the west coast to the Kalihari Desert, comprehending an area of about 100,000 square miles, is known under the name of Great N., being principally inhabited by wandering tribes of Namaquas (q. v.). This region is drained principally by a large periodical water-course, called the Oup, Borradaile, or Great Fish River, which, running from north to south a distance of about 450 miles, joins the Orange River nearly at right angles, about 90 miles from its mouth. It is generally, except in its northern parts, where the country rises into extensive and lofty plateaus, a most sterile and barren region, and along a coast-line of upwards of 400 miles does not present a single running stream, much less a navigable river, although a few little bays along the coast, such as Angra Pequena, Sandwich Harbour, and Walfish Bay, afford safe anchorages. The valley of the Oup is bounded on each side by ranges of flat-topped barren mountains, which to the eastward die away into the waterless though wooded flats of the Kalihari Desert, and coastwards stretch into vast sandy downs, against which the Southern Atlantic beats an unceasing surf, rendering landing very dangerous, and enveloping the coast in a perpetual mist. The chief productions of the region are cattle, for the rearing of which the country seems favourable. On the edge of the Kalihari, ivory and ostrich feathers are collected, and copper ore seems abundant in several localities. Guano is found at Ichaboe and many little islands on the coast, and considerable fisheries are carried on by Cape houses in many of the bays.

The lion, giraffe, rhinoceros, hippopotamus, and large game generally, are still found in N., although fast diminishing before the firearms of the Namaquas. The snakes are considered especially venomous. The gemsbok, eland, and other large antelopes, now almost unknown in the Cape Colony, are still numerous in the little-frequented wastes of this region. The climate is extreme, and though, on the whole, not unhealthy, is very trying to European constitutions. The water is generally brackish. The first English traveller in N. was Sir J. Alexander, who, in 1837, traversed it from north to

south. Charles J. every part of it. be also found in and Le Vaillant. haps number about language, the pure

## NAME

Hottentot tribes soon becoming extinct, or at least absorbed, being gradually supplanted by the more energetic and civilised Bastard races, who, in point of civilisation and appearance, are very little inferior to the ordinary Dutch Boer of Cape Colony. Many of the southern N. possess wagons and oxen, and are employed in the transport of copper ore from the mines of Little Namaqualand to the shipping port at Hondeklip Bay.

A few of the peculiar customs of the Hottentot tribes, described by Kolben nearly 200 years ago, may be still traced amongst the more remote tribes of the N.; but contact with the Cape Colonists, and the efforts of the missionaries, have partially civilised this race, so that an ordinary Hottentot is quite as respectable a savage, or perhaps more so than his Betjouana or Amakosa brethren.

**NAME** (Sax. *nama*, Ger. *name*, Lat. *nomen*, Gr. *onoma*), the word by which a particular person or thing is signified in distinction from other persons or things. A name attached to a person is called a proper name. Names distinguishing one individual from another have been in use from the earliest ages of human society. Among the Jews, the name given to a child either originated in some circumstance of birth, or was an expression of religious sentiment. Old Testament names are almost all original—i. e., given in the first instance to the person bearing them; but the Jews, like other nations, after accumulating a considerable stock of names, began to repeat them, and we find few names in the New Testament which had not been used before. In Old Testament times, it was an occasional practice to adopt a change of name on the occasion of an important event in one's life.

The Greeks bore only one name, given on the eighth day after birth, which it was the right of the father to choose, and alter if he pleased. The earliest Greek names are generally expressive of some quality in high estimation, as valour, skill, wisdom, or gracefulness (Callimachus, excellent singer; Pherecrates, strength bringer; Sophron, wise; Melanthus, black flower). In later times, when the faith in the gods was on the wane, names derived from Apollo and Athene, or indicative of the favour of Olympus (Apollodorus, gift of Apollo), came more into fashion. The eldest son generally bore the name of his paternal grandfather, and the confusion arising from the repetition of the same name was attempted to be obviated by appending the father's name (either simply, or turned into a patronymic), the occupation, the place of birth, or nickname.

The Romans at a very early period bore two names, and afterwards every Roman citizen had three. The *prænomen*, like our Christian name, was personal to the individual—Caius, Marcus, Lucius; in writing, generally abbreviated to an initial or two letters, C., M., or Cn. It was given at early times on the attainment of puberty, and afterwards on the ninth day after birth. There were about thirty recognised *prænomena*. Women had no *prænomen* till marriage, when they took the feminine form of that borne by their husband. Every Roman citizen belonged both to a *gens* and to a *familia* included in that *gens*. The second name was the *nomen gentilitium*, generally ending in *-ius*, *-eius*, or *-aius*. The third name was the hereditary *cognomen* belonging to the *familia*. *Cognomina* were often derived from some bodily peculiarity, or event in the life of the founder of the family. A second *cognomen*, or *agnomen*, as it was called, was sometimes added by way of honorary distinction. In common intercourse, the *prænomen* and *cognomen* were used without the *nomen gentilitium*, as C. Cæsar for C. Julius Cæsar,

M. Cicero for M. Tullius Cicero. The Roman names were in their origin less dignified and aspiring than the Greek; some were derived from ordinary employments, as Porcius (swineherd), Cicero (vetch grower); some from personal peculiarities, Crassus (fat), Naso (long-nosed); a few from numerals, Sextus, Septimus.

The Celtic and Teutonic names, like the Jewish and Greek, had been originally very significant; but at an early period their exuberance became checked; people contented themselves with repeating the old stock. While the speech of Europe was undergoing a transformation, the names in use remained the same; belonging to an obsolete tongue, their signification by and by became unintelligible to the people using them. Many are derived from 'God,' as Gottfried, Godwin; some from an inferior class of gods known by the title *as* or *ans*, whence Anselm, Oscar, Esmond; others from elves or genii, Alfred, Albion, Elfric (Elf King). Bertha is the name of a favourite feminine goddess and source of light, from the same root as the word 'bright'; the same word occurs as a compound in Albrecht, Bertram. To a large class of names indicating such qualities as personal prowess, wisdom, and nobility of birth, belong Hildebrand (war brand), Konrad (bold in counsel), Hlodwig (glorious warrior), called by us Clovis, and the original of Ludwig and Louis. The wolf, the bear, the eagle, the boar, and the lion entered into the composition of many proper names of men, as Adolf (noble wolf), Arnold (valiant eagle), Osborn (God bear). Respect for feminine prowess also appeared in such names as Mathilde (mighty amazon), Wolfhilde (wolf heroine). The spread of Christianity threw a number of the old names into comparative oblivion, and introduced new ones. The name selected at baptism was more frequently taken from the history of the Bible or the church than from the old traditional repertory, which, however, was never altogether disused. Many names, supposed to be local and very ancient, particularly in the Scottish Highlands, Wales, and Cornwall, are in reality but corruptions of names of Christian origin which are in use elsewhere. Owen, Evan, and Eoghan (the latter often Anglicised into Hector) seem all to be forms of Johann or John. A change of name was sometimes made at confirmation.

Periods of religious and political excitement have had a very powerful influence in modifying the fashion in names. The Puritans would only admit of two classes of names, those directly expressive of religious sentiment—Praise-God, Live-well—and names which occur in Scripture; these latter indiscriminately made use of, however obscure their meaning, or however indifferent the character of the original bearer of them. Old Testament names were used in preference to New, probably because they did not convey the notion of a patron saint. Old Testament names still prevail largely in America, where exists a medley of Christian names from all possible sources. At the French Revolution, names supposed to savour of either loyalty or religion were abandoned, and those of Greek and Roman heroes came into vogue instead. The Augustan period of English literature gave a temporary popularity to such feminine names as Narcissa, Celia, Sabina. In Germany, the names in use are particularly free from foreign admixture; they are almost all either of Teutonic origin, or connected with the early history of Christianity. In Britain, the number of names has, particularly since the Reformation, been more limited than in most other countries. In some families of distinction, unusual names have been handed down from father to son for centuries—e. g., Peregrine among the

villages on the other side of the Channel, names which were used with the French preposition *de* before them. Their younger sons and others applied the 'de' to estates awarded them as their portion of the conquered country, and called themselves De Hastings, De Winton, &c., a prefix probably never in vernacular use in England, and completely discarded with the disappearance of Norman-French, unless in a few cases where it was retained for the sake of euphony, or from coalescing with the initial vowel, as in De la Bèche, Danvers (d'Anvers), Dangerfield (d'Angerville). When English was used in place of Norman-French, the 'de' was always rendered into 'of.' The affectation of resuming it in recent times is as unwarrantable in theory as in taste. Such a designation as Lord De Tabley of Tabley House is an unmeaning tautology. The Scotch have a more expressive designation when they say Colquhoun of that Ilk. In France and Germany, a territorial surname (denoted by 'de' or 'von') came, when surnames spread to all classes, to be the mark of nobility, so much so that in later times, when any one was ennobled by the sovereign, the 'de' was prefixed to his previously plebeian and not territorial name. In Britain, the 'de' was never considered the test of nobility; the names of some of the most distinguished families were not territorial—e. g., Stewart, Butler, Spencer. In Scotland, surnames were hardly in use till the 12th c., and were for a long time very variable. The assumption of surnames by the common people is everywhere of much later date than their use by noble (gentle) families. As yet, they can hardly be said to be adopted by the people of the wilder districts of Wales.

There are many existing local surnames in Britain besides those derived from the names of the manors of the gentry or landholders. Farms, homesteads, the natural features of the country, all gave their names to those who resided at or near them; hence such names as Wood, Marsh, Dale. The preposition 'at' is in a few cases retained, as in Atwood, A'Court, Nash (atten-ash, i. e., at the ash). The travelling habits of the Scots account for such names as Inglis, Fleming, Welsh (the original of Wallace), applied to those who had visited foreign parts; and sometimes a Scotsman, wandering into England, returned with the acquired name of Scott.

parson), del Sarto (son of the tailor), personal qualities—Black, White, S Lang (long), Littlejohn, Cruikshank. Names have not unfrequently been p surnames. We have also surnames the signs and cognizances which were middle ages, not only by inns and private houses. John at the Bell, Bell; at Middleburg, in Holland, Sime in the 'Drake,' or Dragon, became S hence, probably, the frequency of derived from animals, and also of the with 'Saint;' though this last class sometimes have had its origin in the the name dedicating himself to the saint in question. In Scotland and I is a distinctive title borne by the head families—as 'The Chisholm,' 'The O' In the Highlands of Scotland, the ch usually addressed by the name alone manner: thus, 'MacLeod' implies spee of Dunvegan, in Skye, head of the c 'Mackintosh,' in like manner, appl Mackintosh of Moy, in Inverness-shire

In England, the number of exist approaches to 40,000, or about one hundred individuals; in Scotland, t fewer surnames in proportion to th The remarkable predominance of cert in certain localities—as Campbell, Cam in Argyshire, Macdonald in Inverne Sutherland, Gordon and Forbes in A and Scott, Ker, Elliot, Maxwell, and the borders—arises from the clansmen a practice of taking the name of considering themselves members of by adoption, if not otherwise. Elsev Scotland, vassals often adopted the n lords, and servants those of their mas more surnames are often borne by a in which case the paternal surname placed first, sometimes last; and, in it is by the name which occurs last th of the two surnames is most frequently

# NAME—NAMUR.

changed for the name of the place of birth—thus, William Longe became William of Wykeham. In time of political troubles, a new name was often assumed for concealment; and in Scotland, the name of McGregor was proscribed in 1664 by an act of the privy council. In modern times, injunctions of settlements of land, and deeds of entail, are frequent grounds for a change of name, it being made a condition that the devisee or donee shall assume a certain surname under penalty of forfeiture, a stipulation which the law recognises as valid. Such an obligation is often combined with one relative to arms. In a Scotch entail, it is a very frequent condition that each succeeding heir of entail, or husband of an heiress of entail, shall assume the entailor's name and arms, or his name and arms *exclusively*; in the former case, he may, if he pleases, continue to use his own surname along with the assumed one. The heir of entail is not held legally to take up any arms not otherwise his own, unless he have applied to the heraldic authorities for leave so to do. Where a Scotch entail contained an injunction to bear arms which had no existence in the official record of arms, the condition has not been held to be null; the heir of entail must apply to the Lord Lyon for a grant of arms bearing the designation of those disposed. In England, it used to be common to obtain a private act of parliament to authorise one to change his surname; and authority for such a proceeding has generally been given in later times by royal licence, which is granted only on a reasonable ground being established for the alteration, to the satisfaction of the kings-at-arms, to whom a remit is made. It has sometimes been supposed that this royal licence is necessary to legalise such a change, but the highest legal authorities have laid it down that there is nothing in the law of England to prevent any one, who may consider it for his interest so to do, to change his surname, or even his Christian name. The idea, formerly prevalent to some extent, is equally erroneous, that an advertisement in a gazette or newspaper, or the execution of some deed, is a necessary form in order to effect a change of name. There are always great inconveniences in changing one's name, which sufficiently account for the general indisposition to do so, except from a questionable motive. As there is no law to prevent a person from changing his name, so there is, on the other hand, no law to compel third parties to use the new name, and disputes and annoyances arising from such a state of things are matters of course. The change tends to a certain extent to destroy the means of identification after the lapse of years, which may or may not be the object desired. Notwithstanding these difficulties and inconveniences, there are many examples of persons who have succeeded after a few years in being generally known under a new name, and of the public as well as his friends recognising it. The change of name, in general, produces no change whatever on the legal status. A party is equally punishable for swindling, larceny, and other cognate offences, whatever name he uses; and, on the other hand, if he is legatee, he is not prevented from establishing and receiving his legacy, whatever name he has adopted. It follows from what precedes that no person is punishable for using a new name, though it is sometimes an ingredient for a jury to take into consideration when they are required to infer a particular motive of conduct. The royal licence is practically required to be obtained by Englishmen (not Scotchmen) holding commissions in the army, as also when the change of name is to be accompanied by a change of arms, it being the practice of the English Herald's College to refuse to

grant arms corresponding to such change, unless the royal licence have been obtained. In Scotland, a *bona fide* change of name requires neither royal, judicial, nor parliamentary authority, the sole exception being the case of members of the College of Justice, who require the permission of the Court of Session. A royal licence is not generally applied for by natives of Scotland, as it is not required to be produced to the Lord Lyon on applying for a corresponding change of arms. The arms will generally be granted when the Lord Lyon is satisfied that the change has been made on some reasonable ground, and not from a purely capricious motive; and the fact of the change of name, with the reason why it has been made, are narrated in the new patent of arms. When such change of surname and corresponding change of arms has been made by a Scotsman who is an officer in the army, the authorities of the War Office are in the habit of requiring a certificate from the Lyon Office to the effect that the change is recognised there.

*Names of places.*—These, like names of persons, belong, in a great measure, to the language of past races. All over Great Britain, a very large proportion are derived from the Celtic names for natural features of the country. From *Gwyng*, *afon*, *tam*, *tav*, *clwyd*—in the Celtic speeches equivalent to *water* or *river*—we have Esk, Avon, Wye, Thames, Tavy, Clyde. *Pen* or *Ben*, hill, gives rise to the names of hills in England and Wales (Penrhys, Penzance), and still more in Scotland (Ben Nevis). So, also, *coch*, *comb*, valley—as in Cumberland, land of valleys. The memory of the Roman invasion has been preserved in the termination *-chester* (derived from *castra*) in the names of towns, as Manchester. Though surnames often originated in local names, the reverse process also occurred; as where *vill*, *ton* or *ington*, *ham*, or *burgh*, has been appended to the name of the owner of the land, e.g., Charleville, Johnston, Wymondham, Edinburgh (i.e., Edwin's burgh).

See Wackernagel, 'Die Germanische Personennamen,' in the *Schweizerische Museum* (1837); Miss Yonge, *History of Christian Names* (Lond. 1863); Lower, *On English Surnames* (Lond. 1849); Professor Innes, *Concerning some Scotch Surnames* (Edin. 1860).

NAMUR, a province of Belgium, bounded on the N. by Brabant and Liège, E. by Luxemburg, W. by Hainault, and S. by France. Area about 1400 square miles. Pop. 313,525 (December 1870). The principal rivers are the Meuse—which entirely intersects the province—the Sambre, and the Lesse. N. presents generally an alternation of fruitful valleys and low hilly tracts; but in some parts, where the heights constitute offshoots of the Ardennes, and are densely wooded, they attain a considerable elevation. With the exception of the land in the south-west, where there are large tracts of bog and heath, the soil is extremely rich, yielding abundant crops and fine pasture. The chief products of N. are wheat, oats, hops, oil yielding plants, and flax. Besides iron, copper, lead, and coal mines, N. has marble and slate quarries, and yields sulphur, alum, cadmium, alumina, flints, &c. It has good steel, iron, and smelting works, breweries, paper-mills, &c. N. is divided into the three arrondissements of Namur, Dinant, and Philippeville. At the close of the 12th c., N. was united to Luxemburg, after having existed as an independent countship for upwards of 150 years. Towards the middle of the 13th c., it passed by purchase to the House of Flanders, which retained possession of it till 1420; when, on the death of Count John III., without direct heirs, the countship, which was in a state of extreme financial embarrassment, was purchased for

132,000 gold ducats, by Philip the Good, Duke of Burgundy, and subsequently shared the fate of the other Burgundian states.

NAMUR (Flem. *Namen*), the chief town of the province of the same name, is situated at the confluence of the Sambre with the Meuse, and is a strongly fortified town and the seat of a bishop. Pop. 29,000 (at the end of 1869). Among its seventeen churches, the cathedral, or St Aubin's, which was consecrated in 1772, is one of the most beautiful churches of Belgium. N. has an academy of painting, a conservatoire for music, two public libraries, a museum, an hospital for aged paupers, a theological seminary, and 2 colleges, one conducted by Jesuits. The present citadel was constructed in 1784, but the city has been fortified from the earliest period of its history; and in 1692, its defensive works were repaired and strengthened by Coehoorn, only, however, to be taken in the following year by Louis XIV. and Vauban, the latter of whom added considerably to its original strength. The reputation of its citadel made N. a prized stronghold in every war of later times; and after having been gallantly defended by its French conquerors, in 1815, against the Prussians under Pirch, it was finally restored to the Netherlands after the battle of Waterloo, and at once put into thorough repair. N. is noted for its cutlery, its leather-works, and its iron and brass foundries.

NANCY, a beautiful town of France, capital of the department of Meurthe-et-Moselle, is situated on the left bank of the river Meurthe, at the foot of wooded and vine-clad hills, 220 miles east of Paris, on the Paris and Strasburg Railway. Pop. (1872) 52,978. It is divided into the old and new towns (the former irregular and with narrow streets, the latter open and handsome), and comprises also two suburbs. It contains many handsome squares and imposing edifices, and owes much of its architectural ornamentation to Stanislaus Leczinsky, who, after abdicating the crown of Poland in 1735, continued to reside here as Duke of Lorraine till his death, in 1766. His statue stands in the Place Royale, a fine square, surrounded by important public buildings, as the Hôtel de Ville, theatre, &c. The gates of N. look more like triumphal arches than the ordinary entrances of a town. Among the institutions are the university-academy, the normal school, the school of medicine, the lyceum, the public library, and numerous art and scientific societies. Cotton, woollen, and linen manufactures are carried on; but the principal branch of industry is the embroidering of cambric, muslin, and jaconet goods.

N. is known to have been in existence in the 11th century. Two centuries later, it became the capital of the Duchy of Lorraine (q. v.). Charles the Bold was killed while besieging the city in 1477.

N'ANDU, or AMERICAN OSTRICH (*Rhea*), a genus of South American birds allied to the ostrich, cassowary, and emu, and most nearly to the ostrich, from which it differs in having the feet three-toed, and each toe armed with a claw; also, in being more completely feathered on the head and neck; in having no tail; and in having the wings better developed and plumed, and terminated by a hooked spur. The wings are indeed better developed than in any other of the *Struthionidae*, although still unfit for flight. The neck has sixteen vertebrae. There are at least three species. The best known species (*R. Americana*) is considerably smaller than the ostrich, standing about five feet high. It is of uniform gray colour, except on the back, which has a brown tint. The male is larger and darker coloured than the female. The back and rump are furnished with long feathers, but of a more ordinary kind

than those of the ostrich. This bird inhabits great grassy plains of South America, south of the equator, abounding on the banks of Plata and its more southern tributaries, as far south as lat. 42° or 43°. Its range does not cross the Cordilleras. It is generally seen in troops. It runs with great celerity, using its wings in aid. It is polygamous, one male securing a harem of two or more females, which lay their

Nandu (*Rhea Americana*).

a common nest, or drop them on the ground near a nest, to which the male rolls them. Contrary to the usual habit of birds, incubation is performed by the male. The N. is shy and wary, but is much hunted by the Indians, generally on horseback. The flesh of the young is not unpleasant. It is capable of being domesticated.—A small, more recently-discovered species (*R. Darwini*) has light-brown plumage, each feather tipped with white. It inhabits Patagonia. A third species (*R. hyemica*) is distinguished by its large bill.

NANKEEN CLOTH. Calico of the kind, 'nankeen,' or nankin, was formerly imported exclusively from China to Europe, and said to be a manufacture of Nanking; the colour, a yellowish-brown, being a favourite one. It was supposed the Chinese held a secret for dyeing this colour, which was found to be remarkably durable; but it is now known that it was not an artificial colour at all, cloth being made of a coloured variety of cotton, which was produced occasionally in China and India. Artificially dyed nankeen cloths now form a considerable export from England to China.

The colour of artificial nankeen cloth is produced by an elaborate process, in which the yarn or cloth is first dipped in a saturated solution of soda, then in a decoction of oak-bark; then in a bath of lime-water; and next in a bath of nitro-muriatic acid. Another, but less permanent, nankeen is produced by boiling annatto in a strong solution of pearl-ashes, and diluting with water to the required tint.

NANKING, capital of the province of Kiangsu, formerly the capital of China, on the Yangtze River, 90 miles from the beginning of its estuary. Lat. 32° 40' 40", E. long. 118° 47'. Its name signifies Southern Capital. Since the removal of the government to Peking (Northern Capital), it has been called by the Chinese Kiangning-fu. The wall encloses an area of nearly 20 miles in circumference, the greater part of which, however, is a waste. They reach in many places an elevation of 70 feet, and are fully thirty feet in thickness at the base. According to Chinese accounts, the population of N. was once 4,000,000, but a more recent estimate

# NANKING—NANTES.

it 300,000. As the city, however, has of late been through so many vicissitudes, it is impossible to ascertain its present number of inhabitants. The walled portion of the walled area lies toward the west, and several miles from the bank of the river. It is no longer possible to speak of N. in the language of former travellers used. The barbaric desolation to which it was subjected during the Taiping rebellion left it a sort of wreck, and one can hardly describe it as it was, before the victorious overthrow of the rebels, on the 19th March 1853. N. is the seat of the vice-regal government for the provinces grouped together under the name of Kiangnan. As elsewhere in China, there was, and again is, a walled city, or military colony, separated by a wall from that portion of the city which is occupied by the Chinese. Some of the finest streets of N. were in the Tartar city; several being nearly 40 feet wide, having a space in the middle of about 8 feet wide, flanked with well-hewn blocks of blue and white marble, and on each side of this a brick pavement 14 feet or more wide. A deep canal or moat runs from the river directly under the walls to the west, serving to strengthen the defences of the city on that side. The ancient palaces have all disappeared. The offices of the public functionaries are numerous, but, like the shops, presented the same features common to all Chinese towns. The objects most worthy the inspection of the traveller are found, in ruins, outside the precincts of the modern city. Among these is the summer palace of the emperor Kienlung. It consisted of a cluster of one-story buildings, with spacious courts and gardens, and flanked by smaller buildings on the sides. Though still remains to shew that the workmanship was of the most elaborate and unique character. Even under cultivation, the spot must have been exceedingly beautiful. The tombs of the kings are remarkable for their sepulchral statues, which form a grand avenue leading up to the graves; they consist of gigantic figures, like warriors cased in a kind of armour, standing on either side of the road, across which, at intervals, large stone tablets are extended, supported by huge blocks of stone instead of pillars. Among the buildings totally destroyed by the rebels is the far-famed Porcelain Tower. It was erected by the emperor Yungloh, to reward the kindness of his mother; the work was commenced in the 10th year of his reign (1413), at noon, on the 15th day of the moon, in the sixth month of the year, and was completed in nineteen years. The board of works ordered, according to the plan of the emperor, to build a tower nine stories high, the bricks and tiles to be glazed, and of 'fine colours'; and it was to be superior to all others, in order to make widely known the virtues of his mother. Its height was to be 222 feet. The ball on its spire to be of brass, laid with gold, so that it might last for ever and never grow dim. From its eight hooks as many chains extended to the eight corners of its roof; and from each chain nine bells, suspended at equal distances apart; these, together with eight from the corners of each projecting roof, amounted to 144 bells. On the outer face of each story were 16 lanterns, 128 in all; which, with 12 bells inside, made 140. It required 64 catties of oil to fill them. On the top of the highest roof were two brazen vessels, weighing together 1200 lbs., and a brazen bowl besides, weighing 600 lbs. Encircling the spire were nine iron rings, the largest being 63 feet in circumference, and the smallest 24 feet, altogether weighing nearly 5000 lbs. In the bowl on the top were deposited one shining pearl, one fire-averting pearl, one water-averting pearl, one wind-averting pearl, a lump of gold weighing 50

ounces, a box of tea-leaves, 1000 taels of silver, one lump of orpiment, altogether weighing 4000 pounds; one precious stone-gem, 1000 strings of copper coin, two pieces of yellow satin, and four copies of Buddhist classics. N. continued in possession of the Taiping rebels till the successes of the troops under Major Gordon had crushed one after another all their outlying forces, when at length, on the 19th of July 1864, the city was stormed by the imperialist soldiers under the viceroy Tseng Kwo-fan. The last blow was thus dealt to the Taiping rebellion, whose principal leader perished by his own hand amid the blazing ruins of the palace he had occupied for eleven years. Since its recapture, N. has resumed its former position as the seat of the vice-regal government, but shews few signs of revival from its desolation. It has, however, been made the headquarters of a large military force, and also of an arsenal for the manufacture of cannon and other warlike stores on the European model. Although specified in the Treaty of Tientsin (1858) as a river-port to be opened, no steps have been taken to proclaim it one.—Dr Macgowan, *North China Herald*, and *Treaty Ports of China and Japan* (1867).

NANTES (anc. *Nannetes*, or *Nannetes*), an important seaport town of France, capital of the department of Loire-Inférieure, is situated on the right bank of the Loire, 30 miles from its mouth, and at the point of confluence with it of the Erdre and the Sèvre-Nantaise, both navigable streams. Besides railways, there is communication with the interior by steamers on the Loire. The natural beauties of the site have been much improved by art, and now, the noble river on which the town is placed, covered with craft of every size and description, the islands that stud its channel, the meadows that skirt its banks, and the bridges (upwards of 16 in number) that cross it and its tributaries here, combine to make the scene a highly picturesque one. N. contains numerous squares and churches. Several districts of the town are nearly as fine as the best districts of Paris, the old town having been pulled down between 1865 and 1870. This town possesses numerous striking and beautiful buildings; among which the cathedral of St Pierre, containing the splendid monument of Francis II., the last Duke of Bretagne, and of Marguerite, his wife; and the old castle, the temporary residence of most of the kings of France since Charles VIII., and built in 938, are the chief. There is a public library containing 50,000 vols.; a museum of paintings; and a museum of natural history. The quays, lined on one side with houses, and in some cases planted with trees, afford an agreeable and interesting promenade of about two miles in length. The most beautiful promenade, however, formed by the Cours St Pierre and the Cours St André, extends from the Erdre to the Loire. It is planted with four rows of trees, bordered with lines of palatial houses, and ornamented with statues. The harbour, 1968 yards in length, is capable of accommodating upwards of 200 vessels. Formerly, vessels of no more than 200 tons could reach the port, all vessels of greater burden unloading at Paimbœuf, at the mouth of the river; but within recent years, much has been done by dredging for the improvement of the river-bed, and large vessels can now reach the harbour. The chief manufactures of N. are varieties of linen and cotton fabrics, calicoes, flannels; musical, mathematical, and optical instruments; refined sugar and salt, chemical products, cordage, &c. It contains tanyards, copper foundries, brandy distilleries, &c., and numerous establishments engaged in the various manufactures to which a port gives rise, as

the Reformed faith were also to be eligible to all civil offices and dignities; but, on the other hand, they were not allowed to print books on the tenets of their religion, except in those places where it existed; and they were obliged to outwardly celebrate the festivals of the Catholic Church, and to pay tithes to the Catholic priesthood. From this period, the Reformers or Huguenots (who then counted 760 churches) had a legal existence in France, but gradually their political strength was crushed by the mighty genius of Richelieu—who, however, never dreamed of interfering with their liberty of worship. Neither did his successors, Mazarin and Colbert; but under the influence of a 'penitence,' as corrupt and sensual as the sins which occasioned it, Louis XIV., after a series of detestable *Dragonnades* (q. v.), signed a decree for the revocation of the edict, 18th October 1685.—The result of this despotic act was that, rather than conform to the established religion, 400,000 Protestants—among the most industrious, the most intelligent, and the most religious of the nation—quitted France, and took refuge in Great Britain, Holland, Prussia, Switzerland, and America. The loss to France was immense; the gain to other countries, no less. Composed largely of merchants, manufacturers, and skilled artisans, they carried with them their knowledge, taste, and aptitude for business. From them England, in particular, learned the art of manufacturing silk, crystal glasses, and the more delicate kinds of jewellery.

**NANTU'CKET**, an island and town upon it, on the south-east coast of Massachusetts. The island is 15 miles long and an average of 4 wide, with an area of 50 square miles. It was bought from the Indians by Thomas Macy, in 1659, for £30 and two beaver-hats. In 1870, 25 vessels belonged to the port of N., of an aggregate burden of 2394 tons. The shipping of N. used to be much employed in fisheries; but in 1867, only 5 of its vessels were so engaged. The harbour is commodious and safe. N. has 9 churches and 2 newspapers; pop. (1870) 4123.

**NA'NTWICH**, a small market-town of Cheshire, England, on the Weaver, 20 miles south-east of Chester. Many of its houses are interesting from their age and construction, being built, in many cases, of timber and plaster, and with overhanging

roofs, but resembles it in general can generally be substituted for it.

Crude Naphtha, whether occurring as a natural product, or as obtained from coal-tar by agitation with strong sulphuric acid, must be well washed with water (which is quite insoluble), and finally distilled. Pure naphtha is colourless, and of a strong and odour; it is soluble in about 10 parts of bulk of alcohol, and dissolves in ether and in the essential oils. It dissolves phosphorus and sulphur, but not on cooling. It is an excellent solvent of percha, caoutchouc, camphor, and fatty bodies generally; and hence it is employed in the arts for these purposes, and is also as a source of artificial light is almost universal. In consequence of its affinity for oxygen, it is employed by chemists in the preparation of potassium and other metals, and its powerful affinity for oxygen. Owing to its inflammability, it must be handled with great caution, many fatal cases having occurred from its vapour catching fire on the approach of a flame.

The principal kinds of naphtha known in commerce are native naphtha, coal naphtha (also called paraffin oil), shale naphtha, and naphtha from caoutchine.

Native naphtha, petroleum, or rock oil, is found in many parts of the world, as in Japan, Persia, the shores of the Caspian Sea, France, and North America. It exists in degrees of consistency, from a thin, light fluid found in Persia, with a specific gravity about 0.750, to a substance as thick as pitch, nearly as heavy as water. But all the different kinds contain nearly the same constituents, contain no oxygen, and consist of hydrogen compounds only. Bitumens are closely allied substances in a solid form. From a very early period in the history of Japan, and at least since last century, native naphtha has been used to burn.

Coal-tar naphtha (see GAS-TAR), as obtained from coal-tar, is of a higher specific gravity than native naphtha—viz., from 0.860 to 0.900, and has a disagreeable and penetrating odour.

## NAPHTHA.

in the sandstone roof of a coal-mine, conjectured that it originated by the action of heat on the coal, the vapour from which had condensed in the stone, and supposed from this that it might be produced artificially. Following up this idea, he did a great many experiments, and ultimately succeeded, by distilling coal at a low red-heat, in obtaining a substance resembling petroleum, which, when treated in the same way as the natural petroleum, yielded similar products. The obtaining of these oils and the solid substance paraffin formed the subject of his now celebrated patent, dated October 17, 1850.

In the years 1860 and 1864, long and costly litigations as to the validity of Mr Young's patent took place in Edinburgh and London, resulting in a decision in his favour. Many years ago, Reichbach had, by distilling 100 lbs. of pit-coal, obtained nearly two ounces of an oily liquid exactly resembling natural naphtha; and various other chemical writers were appealed to, as proving that the products substantially the same as Mr Young's were previously known and practised. One thing seems to have been admitted, that previous to his patent, no one had succeeded in producing the oil on a commercial scale.

The processes by which the oil and paraffin are obtained are simple. The material best adapted for the purpose was for years believed to be Boghead coal, a very rich gas-coal, occurring in a field of limited extent near Bathgate, in Linlithgowshire. All cannel coals, however, give the same products, and some of them in nearly as large quantity; but, as stated below, shale is now generated and treated in the same way. The coal is broken into fragments like road-metal, and gradually heated to redness in cast-iron retorts, which are similar to those used for coal-gas (see Gas). The retorts are most usually upright, about 10 feet high and 14 inches in diameter at the bottom, tapering to 12 inches at the top, and built in sets of three or six, so that one fire may heat each set. The coal is fed by means of a hopper on the top of the retort, and after passing through it at a low red-heat, is drawn out as coke at the bottom, where it is a water lute to prevent the escape of oil or gas.

There is a spherical valve in the hopper, counterpoised with a weight, which closes the retort at the top. The volatile matters distilled from the coal are conducted by a pipe to the condensers (similar to those used for coal-gas), where they are condensed into a thick black oil, of a specific gravity about 0.900, along with a little water. Great care is necessary to prevent the heat from becoming too high, because gas and gas-tar, and not refined oil, are obtained when coal or shale is heated at a high temperature. A ton of Boghead coal gave about 120 gallons of crude oil.

The crude oil from the first distillation is then distilled again in long cylindrical malleable-iron retorts. From this second distillation a 'green oil' is obtained, and the residue is removed as coke from the bottom of the still. This oil is then mixed with 5 to 10 per cent. of sulphuric acid, and afterwards with about the same quantity of soda, the mixture being made in circular tanks with revolving stirrers. Both the acid and the soda mixtures, which fall to the bottom as heavy tarry matters, are run off by a stop-cock, till only the supernatant oil remains. After being so far treated, the oil undergoes three further distillations, being at the same time treated with strong sulphuric acid (1 per cent.) and soda. The final result is, that all quantity of light naphtha is obtained in the first distillations, three-fourths of what is left being a thick and nearly colourless oil used for burning in

lamps, and the remainder a thicker oil containing paraffin. This latter portion is pressed in a hydraulic press, which squeezes out the greater portion of the paraffin, leaving an oil which is sold for lubricating machinery.

The crude paraffin, after being subjected to hydraulic pressure three or four times, is chiefly purified, by repeated crystallisations, from naphtha. Steam is afterwards blown through it in a melted state, and when finally treated with 3 per cent. of animal charcoal, it is an exquisitely beautiful substance, resembling the purest white wax. It is largely manufactured into candles, which equal, or even excel, in appearance those made from wax, and are only about half as costly. Paraffin has now a number of curious minor applications.

Shale naphtha, or 'shale-oil,' is a substance which has been manufactured, for many years, from bituminous shales both in England and on the continent. Partly because the Boghead coal has become practically exhausted, but chiefly because the volatile products from it are more easily purified than from any coal, beds of bituminous shale found in the carboniferous formation are now almost entirely used in Scotland as the raw material from which paraffin oil and paraffin are obtained. Previous to 1856, these shales were turned to no account. See SHALE.

Naphtha from caoutchouc, or caoutchine, is obtained from caoutchouc by destructive distillation. In composition it consists mainly of hydrocarbons, having the same proportion of carbon to hydrogen as india-rubber. Caoutchine has the reputation of being one of the best known solvents for india-rubber.

Until the discovery of the Pennsylvanian, the Burmese (Rangoon) petroleum or rock-oil was one of the best known. It is obtained in a treacherous state by sinking wells about sixty feet deep in the soil, and consists of several fluid hydrocarbons, with about ten or eleven per cent. of the solid hydrocarbon paraffin. The different naphthas it contains are highly prized as burning and lubricating oils, and for removing greasy stains, on account of their agreeable smell. The naphtha which is found abundantly at Baku, on the shores of the Caspian Sea, closely resembles the Rangoon in its qualities. The Persian naphtha is frequently pure enough for burning without rectification.

Prominent among the wonders of our time, however, as regards new fields of industry and wealth, stand the discoveries of the naphtha, or, as they are called, the petroleum regions of the United States. Some of these sources of native naphtha were known to the Indians, by whom it was at one time collected for sale; but it is little more than twenty years since, by sinking deep wells, the great extent of the oil-bearing strata became known. The principal supplies are obtained in Pennsylvania, West Virginia, and Ohio, a considerable quantity being also obtained in West Canada. Other regions in North America produce it, but the Pennsylvanian yield is six or seven times greater than all the rest put together. Consul Kortright, in his report on the states of Pennsylvania, Ohio, &c., for 1870 and 1871, says: 'The oil regions are 100 miles in length by 30 to 50 in breadth, and the number of wells to be tapped so great, that the supply is considered to be sufficient for a century to come at least.'

Much curiosity exists respecting the origin of these great natural sources of petroleum. It seems to be the general opinion of geologists that it has in most cases been produced by the decomposition of both vegetable and animal matters. In this respect it differs from coal, which has arisen from the decay of vegetable matter alone. It would appear that the Pennsylvanian oil proceeds from shales of carbon-

# NAPHTHALIC GROUP OR SERIES—NAPIER.

iferous age; the Canadian, from those of Devonian age. In both countries the oil is found in cavities in sandstone, and has therefore been derived from subjacent rocks. It is now known that petroleum has formed in rocks of nearly all geological ages. Professor Dana, the American mineralogist, says that the conditions favourable to the formation of native naphtha, as shewn by the characteristics of the deposits in which it is found, are: (1) the diffusion of organic material through a fine mud or clay; (2) the material in a very finely divided state; and (3), as a consequence of the preceding, the atmosphere excluded as far as possible from the material undergoing decomposition.

In Pennsylvania the first borings for petroleum took place in 1859, and in that year 82,000 barrels (reckoned at 43 gallons each) were obtained; in 1861, the produce had reached 2 million barrels; and since then, as a rule, it has increased from year to year. In 1872, the total produce of North America was 7,394,000 barrels; Canada furnishing 530,000 barrels. In the same year the total exports from the United States of refined petroleum amounted to 2,951,310 barrels, an enormous quantity, considering the first exports took place so recently as 1861. Of late years, the petroleum trade is said to have employed in North America as many hands as coal-mining and the working of iron.

In 1862 and 1871, acts of parliament were passed limiting the amount of petroleum to be kept in store, and regulating the sale of such kinds as give off an inflammable vapour below 100° F. There are special warehouses for the reception of petroleum at the London and Liverpool docks.

Terrible accidents have now and then happened with some of the more inflammable American oils, by reason of their vapours exploding in the reservoirs of lamps. Most of these have, no doubt, taken place with oils whose vapours form an explosive mixture with air at a temperature below 100° F., but they can hardly be considered safe if their vapours will take fire on the approach of a light at less than 120° F. The vapour of the paraffin oil prepared for illuminating purposes by Young's Mineral Oil Company, and no doubt by other firms, from Scotch shale, will not form an explosive mixture below 120° F., and it is therefore quite safe. Since this oil has to compete with petroleum, such a standard can only be kept up at a loss, and there is therefore a great temptation to keep down the firing-point of these burning oils as low as possible, with a view to greater profit; and although accidents have happened with paraffin oil, as well as with American petroleum, there is little doubt that the latter cannot be so thoroughly relied upon for safety. It could easily be made so, however, if the lighter hydro-carbons which it contains were carefully removed.

**NAPHTHALIC GROUP OR SERIES.** The starting-point of the group is *Naphthalin* ( $C_{10}H_8$ ), a substance of great interest in the history of organic chemistry, from its being that upon which Laurent chiefly founded his Theory of Substitutions. It may be obtained in various ways, but is most easily and abundantly produced from the last portions of the distillate of coal-tar, which become semi-solid on cooling. The liquid part of this mass is got rid of by pressure, and the naphthalin is then taken up by hot alcohol, from which it is obtained in a pure state by crystallisation and sublimation.

Naphthalin crystallises in large, thin, rhombic plates, which are unctuous to the touch, and have a pearly lustre. Exposed to light under a glass covering, it gradually sublimes at an ordinary temperature in splendid crystals. It has a somewhat tar-like odour, and a pungent and somewhat

aromatic taste. It fuses at 174°, and boils at 218°. Its specific gravity, in the solid state, is 1.15; as a vapour, 4.528. It is not very inflammable when ignited, burns with a white smoky flame, is insoluble in water, but dissolves in alcohol, ether, and the fixed and essential oils.

By acting on naphthalin with an excess of sulphuric acid, we obtain *sulpho-naphthalin* ( $C_{10}H_7SO_3H + 2Aq$ ), from which, by subsequent processes, a large number of compounds are produced. With nitric acid, naphthalin yields *naphthalin* [ $C_{10}H_7(NO_2)$ ], *binthro-naphthalin* [ $C_{10}H_7(NO_2)_2$ ], and *trinitro-naphthalin* [ $C_{10}H_7(NO_2)_3$ ], or its multiples, being substituted one, two, and three equivalents of the hydrogens of the naphthalin. The final product of the action of boiling nitric acid on naphthalin is a mixture of oxalic and *naphtholic* or *phthalic* acids, the re-action being shewn by the equation:

This acid is also obtained by the continued action of nitric acid upon alizarin, which is an indication, since it indicates a connection between naphthalin and the colouring matter of madder.

Laurent has discovered a very numerous series of substitution compounds formed upon naphthalin, into the composition of which chlorine enters. They are of little practical importance although their investigation has had a remarkable influence upon the progress of organic chemistry.

**NAPIER, JOHN, Laird of Merchiston** was born at Merchiston Castle, near Edinburgh, in 1550, and died there on the 4th of April, 1617. After attending the regular course in Arts at the university of St Andrews, he travelled for some time on the continent, and returned to his country highly informed and cultivated for his time. Declining all civil employments, for which his accomplishments eminently fitted him, he passed the seclusion of a life devoted to literary and scientific study. From this time his history is blank till 1593, when he published his *Discovery (or 'Interpretation') of the whole Book of Saint John* (Edin. 5th ed. 4to, 1643), a work displaying great acuteness and ingenuity, but scarcely necessary to add, not in any sense a 'discovery' of the apocalypse. In the death of King James VI., he gave his majesty some plain advice regarding the propriety of reforming his 'house, family, and court;' and on finishing the work, he added a supplement, in which 'certain doubts moved by some well-wishers to his brethren.' About this time he seems to have devoted much of his time to the invention of warlike machines, but these inventions were never perfected, probably from motives of humanity. Other eminent men of the time, N., though a Presbyterian, seems to have been a believer in astrology and divination, but there is no satisfactory proof that he ever practised these arts. In 1611 he proposed the use of salt as a fertiliser of land, a suggestion which, though scouted at the time, is now generally received. Another large blank in his history occurs, and terminates in 1614, at which date he first gave to the world his famous invention, *Logarithms* (q.v.), in a treatise entitled *Logarithmorum Canonis Descriptio* (4to, Edin.). This was followed by another work, *Arithmetice numerationis per Virgulas libri duo* (Edin. 1617), detailing an invention for simplifying and shortening the processes of multiplication and division. **NAPIER'S BONES.** He also prepared a second edition of *Logarithms*, shewing their mode of construction.

# NAPIER.

lication, with an appendix containing several  
ions of spherical trigonometry, and those for-  
hich are now known by his name. This work  
olished after his death by his son Robert,  
he title of *Mirifici Logarithmorum Canonis*  
tio, &c., quibus accessere Propositiones ad  
da sphaerica faciliore calculo resolvenda, &c.  
(1619), and occurs along with the *Canonis*  
so. The latter work is included in Baron  
s extensive collection, the *Scriptores Logar-*  
Lond. 1808). N.'s eldest son, Archibald, was  
o the peerage as the first Lord Napier by  
I. in 1627, and his descendants still bear  
a. Two lives of N. have been published, the  
the Earl of Buchan (1787), and the other  
dark Napier (1834).

IER, SIR CHARLES JAMES, G.C.B., English  
one of several brothers distinguished for  
nary, three of whom—Charles, William,  
orge—were known in the Peninsular War  
llington's Colonels.' They were sons, by a  
marriage, of Hon. Colonel George Napier,  
a of Francis, fifth Lord Napier, who was  
descent, but through two females in suc-  
cess from the inventor of Logarithms. Charles,  
st, was born at Whitehall, Westminster,  
10, 1782. Before he had finished his  
year, young N. received a commis-  
sion in the 22d Foot. His first service was in  
where he assisted in putting down the  
He commanded the 50th Foot during  
eat on Corunna; and at the fatal battle  
Sir J. Moore fell, he was wounded in  
ces and made prisoner. Marshal Ney  
d him, with permission to go to England  
e. On his return, he engaged in literary  
nd even wrote an historical romance. In  
returned to the Peninsula. At Coa, where  
st as a volunteer, he had two horses shot  
im. At Busaco, he was shot in the face,  
his jaw broken and his eye injured. He  
d in time to be present at the battle of  
d'Onoro and the second siege of Badajoz,  
distinguishing himself in innumerable skir-  
the daring soldier returned to England.  
took part in a fighting cruise off the  
ake, capturing American vessels, and making  
descents upon the coasts. He did not  
o Europe soon enough for Waterloo, but  
ged in the storming of Cambray, and accom-  
panied army to Paris. After the peace he was,  
made governor of the island of Cephalonia,  
rs of which he administered with great  
and intelligence. Being, however, of an  
dy combative disposition, he became em-  
with the authorities at home. In 1841,  
ordered to India to assume the command of  
y at Bombay. This was the most splendid  
f his career, resulting in the conquest of  
gainst terrible odds. His destruction of a  
ion called Emaun Ghur in 1843, was described  
ake of Wellington as one of the most remark-  
able feats he had ever heard of. The fearful  
f Meanee followed, where N., with 1600  
and sepoys, defeated near 30,000 Beloo-  
rongly posted, with the loss of 6000 men.  
seers surrendered, except Shere Mahomed,  
ught 25,000 men into line of battle at  
d. N. had only 5000 men, but in three  
is little army gained a decisive victory.  
ays afterwards, N. was in the palace of the  
and master of Scinde. He was fortunate  
using the entire confidence of Lord Ellen-  
who made him governor of Scinde. His  
ministration was scarcely less remarkable or  
successful than his military operations. He

gained the respect and reverence of the inhabitants,  
but soon became engaged in an acrimonious war of  
despatches with the directors. In 1847, he returned  
to England. After attending a series of festivals  
in his honour, he lived in retirement until the  
disasters of the last Sikh war caused the eyes of his  
countrymen to be turned to the hero of Scinde as  
the deliverer of our Indian empire. He went to  
India, but found on his arrival that the Sikhs had  
been routed. He now turned his attention, as com-  
mander-in-chief of the army in India, to the subject  
of military reform. He bade a final adieu to the  
East in 1851, and returned to his native country,  
where he resided until his death, which took place  
at his seat, at Oaklands, near Portsmouth, August  
29, 1853. He had then attained the rank of lieu-  
tenant-general, was G.C.B., and colonel of the 22d  
Foot. It must be remembered to his honour that  
he was the first English general who ever recorded  
in his despatches the names of private soldiers who  
had distinguished themselves, side by side with  
those of officers. Brave to rashness, ready alike  
with tongue, pen, and sword, quarrelsome with his  
superiors, but beloved by his soldiers, and, to crown  
all, of a strangely wild yet noble and striking  
appearance, N. was one of the most remarkable  
men of his time, and in losing him the country  
lost one of its brightest military ornaments. His  
statue was, after his death, erected in Trafalgar  
Square. The story of his *Conquest of Scinde* has  
been written by his brother, Lieutenant-General  
SIR WILLIAM FRANCIS PATRICK NAPIER, K.C.B.,  
born 17th December 1785, who served in the  
Peninsular campaign, and was engaged from 1824  
to 1840 in preparing his *History of the Peninsular*  
*War*, the greatest military history in the English  
language. He died February 12, 1860, at Scinde  
House, Clapham, and was followed in a few  
weeks to the tomb by his wife, Lady Napier,  
niece of the great C. J. Fox. Her extraordinary  
skill in translating French documents written in  
cypher, and her indefatigable labours as her hus-  
band's amanuensis, are touchingly commemorated  
in the preface to the edition of the *History of the*  
*Peninsular War*, published in 1851.

NAPIER, SIR CHARLES, K.C.B., English admiral,  
was cousin to the hero of Scinde and the historian  
of the Peninsular War. His father was the Hon.  
Captain Charles Napier, R.N., second son of Francis,  
fifth Lord Napier. He was born March 6, 1786, at  
the family seat, Merchistoun Hall, in the county of  
Stirling. At 13, he went to sea as a naval volunteer.  
In 1808, he received the command of the *Recruit*,  
18 guns, and had his thigh broken by a bullet  
while engaging within pistol-shot the *Diligente*, a  
French corvette of 22 guns. At the reduction of  
Martinique he took a principal fort, accompanied  
by only five men. He kept up a running fight, in  
his 18-gun brig, with the rearmost of three French  
line-of-battle-ships, the *D'Hautpoult*, which escaped  
from Guadeloupe, and was thus instrumental in  
her capture. This obtained him a post-captaincy;  
but being thrown out of active service, he served  
ashore as a volunteer in the Peninsular army 'by  
way of amusement,' as he expressed it. 'Black  
Charley,' as he was called, was present at Busaco  
with his cousins, and received a wound in the battle.  
In 1811, he obtained the command of the *Thames*,  
32 guns. He inflicted an incredible amount of  
damage upon the enemy in the Mediterranean,  
and put a stop to their attempts to construct  
a fleet. He also conducted several desperate  
land operations with such marked success, that  
a high authority has declared that his genius  
was essentially military. In 1814, he was ordered  
to America, and led the way in the hazardous

# NAPIER'S BONES—NAPLES.

ascent and descent of the Potomac. He afterwards took an active part in the operations against Baltimore. After the war, he settled in Paris, where he established the first steamers on the Seine. In 1829, he received the command of the *Galatea*, a 42-gun frigate, and was employed 'on particular service' on the coast of Portugal and in the Azores. He thus became acquainted with the leaders of the Constitutional party, and accepted the command of the fleet of the young queen. He sailed in search of the Miguelite fleet, and, although vastly over-matched, did not hesitate to engage it. He ran his 32-gun frigate, the *Rainha*, alongside of the *Don John*, of 80 guns, and carried her by boarding. This action concluded the war, and placed Donna Maria on the throne. He was made admiral-in-chief of the Portuguese navy, and attempted to remodel it; but official and corrupt influence was too strong for him, and he returned to England. He was appointed to the *Powerful*, 84 guns, and when the war between the Porte and Mehemet Ali broke out, he was despatched to Beyrout. He organised a land force, with which he stormed Sidon, and defeated Ibrahim Pasha among the heights of Mount Lebanon. He took part in the naval attack on Acre, and did not hesitate to disregard the orders of his chief, Admiral Stopford, when he saw the way to bring the battle to a speedy termination. He next blockaded Alexandria, and concluded a convention with Mehemet Ali, which, although at first repudiated, was eventually adopted by the allied powers. In 1841, he was elected M.P. for Marylebone. In 1847, he received the command of the Channel fleet. When the Russian War broke out, he was sent out to command the Baltic fleet. The capture of Bomarsund failed to realise the high expectations formed of N.'s exploits. In 1855, he was returned to parliament as M.P. for Southwark, and, until his death, November 6, 1860, he laboured with success to reform our naval administration, and improve the condition of our seamen. He died at Merchiston Hall, Horndean, Hants, and was at the time of his death a vice-admiral and a knight of several foreign orders.

NAPIER'S BONES, an invention of the celebrated Napier (q. v.) of Merchiston, for the purpose of performing mechanically the operations of multiplication and division. The 'bones' were narrow

Napier's Bones.

slips of bone, wood, ivory, or metal, about 3 inches long by 3-10ths of an inch in breadth, and divided by transverse lines into nine compartments; each of these compartments being divided into two portions

by a diagonal line running from the hand to the lower left hand corners. were divided into sets, all those of one the same digit occupying the top compartment the several multiples of that digit in order the eight lower compartments. multiple consisted of two figures, these one on each side of the diagonal line, necessarily a set of bones for each digit, also another rod similarly divided in compartments, in which were placed the nine was called the *index-rod*. Multiplication formed as follows; e.g., if 6795 is to be multiplied by 97834, four rods (see fig.) whose top 6, 7, 9, 5 are selected, and arranged in the figures in the multiplicand, and then placed alongside them, as in the figure; figures of the multiplier are then set on the index-rod, the two lines of figures each figure on the index are then added diagonally, and the five sums thus arranged as follows:

```

9 61155
7 47565
8 54360
3 20385
4 27180

```

664782030 = the product required

Division is performed in an analogous manner. The contemporaneous invention of logarithms for the same purpose of converting multiplication into addition and subtraction, Napier's bones to be overlooked, and they are scarcely ever used.

NA'PLES (Ital. *Napoli*, anc. *Neapolis*), a city of Southern Italy, capital of the province of Naples. It is built partly at the base, partly on the slope of two crescent-shaped acclivities on the flanks of the same name. Pop. (1872) 448,333. Lat. 40° 51' 8" N., long. 14° 15' 5" E. The wonderful beauty of the site and of the surrounding prospect, the delicious softness of the climate, and the pure atmosphere, make N. famed among the cities of the world. It is one of the chief centres of commerce and industry of Italy, possesses a very extensive mercantile shipping, and is one of the principal stations of Mediterranean steam-navigation.

The public buildings of Naples are numerous and grand, but are devoid of architectural symmetry, consequence of the antiquity of their origin and irregularity of their site. Many of the old streets are paved with lava, and inconveniently narrow, with houses of great height. The modern streets, however, are spacious and splendid. The city is divided into the Old and the New Town, or the East and West Crescents, by a lesser range of heights, viz., the Capodemonte, the St Elmo, and the Pizzardi cone, terminating in the rocky promontory called 'Castel dell' Ovo'. In 1868, a landslide destroyed a number of houses at the foot of Pizzardi cone. The eastern division of N. is the most ancient and most densely peopled; it contains the principal public structures, and is intersected by the spine of the city, the Via or Street di Toledo. The western, or modern section, contains the famous Riviera di Chiaia, the Quay, a fine road running along the bay, a curved course of three miles, flanked on the right by a row of palaces, and bordered on the left by beautiful pleasure-grounds of the Villa Reale, which lie between it and the sea, and of which the natural beauty is heightened by the interspersing of temples, fountains, and statuary groups, and the acacia, myrtle, and orange groves. The squares, or *larghi*, of N. are adorned with fountains and obelisks; and within the precincts of the

## NAPLES.

There are several highly-prized springs both of fresh and mineral waters. The fortified castles are numerous. Amongst the principal are the Castel Nuovo, called the Bastile of Naples, somewhat similar to the Tower of London, and adorned with a fine triumphal arch, erected in honour of Alfonso of Aragon; the Castel dell'Ovo, so called from its oval or egg shape, standing on a promontory, and connected by a bridge with the mainland; the Castel Sant' Elmo, commanding a magnificent view from its ramparts, and formerly of immense strength; and the dismantled Castel Carmine. The churches are upwards of 300, and many are rich in architectural and archaeological interest. The cathedral dedicated to St Gennaro (patron saint; q.v.) contains the celebrated phials in which the liquefaction of St Gennaro's blood is alleged to take place on two annual festivals; it also contains the tombs of Charles of Anjou and of Pope Innocent IV., besides numerous fine paintings and statues. The educational institutions of N. embrace famous schools of surgery, law, and general science. A magnificent aquarium has been opened since 1871, with a zoological laboratory in which many distinguished foreign naturalists are at work. The philanthropical establishments are on an immense scale, and are richly endowed. There are also several theatres in the city, of which that of *San Carlo* (devoted to the Opera) is one of the largest and most celebrated in Italy; but the characteristic theatre of N. is the *Teatro di San Carlino*, the headquarters of *Pulcinella* ('the Italian Punch'). There are four grand public libraries; and in the Museo Aragonico, N. contains an unrivalled collection of paintings, comprising frescoes, paintings, mosaics, sculptures, bronzes, antiquities, coins, medals, inscriptions, and the renowned collection of precious objects saved from Herculaneum and Pompeii.

The environs of N., apart from their extreme beauty of scenery, are highly interesting. The locality which contains the tomb of Virgil, the buried towns of Herculaneum and Pompeii, and Mount Vesuvius (from an eruption of which N. suffered in 1872), and the Roman remains, must possess an inexhaustible source of interest for scientific, antiquarian, and classical investigators. The modern villas of N. are splendid and luxurious. One of the most striking features of N. is its unique position and the universal publicity in which life is passed. The inhabitants for ever swarm in the thoroughfares, where an incessant throng of vendors, refreshers, and idlers intermingle with asses, mules, and carts, and conveyances, dazzling the eye with their brilliant variety of costume, and the pan-mimic expressiveness of their frantic gestures and attitudes; while the ear is stunned by the shrill shrieking cries of the ambulatory vendors of every conceivable commodity, by the piercing notes of the improvisatore's song, and the uproarious hilarity of high-pitched patois of the countless masses, whose sole abode appears to strangers to be the longed public squares and streets. The popular language of N., which is a corrupt dialect of Italian and Spanish, is in prevalent use among all classes of society; it lends itself especially to the satirical and facetious squibs and compositions in which the Neapolitans excel. The popular Neapolitan songs, the native patois are exquisitely naive and expressive in sentiment, and are set to popular melodies which exert a maddening charm over this southern populace. The physical condition of the lower classes of N., and especially of the *lazzaroni* (q.v.), has of late years sensibly improved both as regards raiment and lodging.

The name Naples (Gr. *Neapolis*, new city) had reference to an older town in the neighbourhood, called originally Parthenope, and, after the foundation of the new town, Palæopolis (old town), which was situated most probably on the ridge called Posilipo, that separates the Bay of Pozzuoli or Baia from that of Naples. Both towns were Greek settlements, apparently colonies from the neighbouring Cumæ, joined by immigrants direct from Greece. In 327 B.C., Palæopolis was besieged and taken by the Romans, and thenceforth disappears from history; Neapolis submitted without resistance, and became a favoured and faithful ally, or rather provincial city of Rome. It long, however, retained its purely Greek character and institutions; and there is evidence that the Greek language continued to be used, even in public documents, as late as the 2d c. of the Christian era. N. was a flourishing and populous city during the Roman empire; and, notwithstanding the vicissitudes of the Gothic conquest of Italy, and the reconquests by the Byzantine emperors, it continued to be one of the most important and opulent places in Italy. About the 8th c., it threw off allegiance to the Byzantine emperors, remained independent till it fell into the hands of the Normans in 1140 A.D., and became the capital of the kingdom of Naples.

NAPLES, Bay of, an indentation of the Mediterranean Sea on the south-west coast of Italy, opposite the city of Naples, is 20 miles wide from Cape Miseno on the north-west to Cape Campanella on the south-east, and from this line extends inland for about ten miles. The scenery is very beautiful. On the shores are many towns and villages; the prospect is bounded on the east by Mount Vesuvius, and on the outskirts of the bay are the islands of Ischia and Capri.

NAPLES. The Italian provinces (formerly kingdom) of N. and Sicily, or the Two Sicilies, occupy the south end of the Italian peninsula, and consist of the continental territory of N. and the insular dependency of Sicily. The distinctive physical features of N. and Sicily are noted under the names of the different provinces of Italy and in the article SICILY. They are favoured by nature with a salubrious and almost tropical climate, unbounded fertility, and teeming population; and they present natural features of rare attractiveness. The rural population are an acute, frugal, and laborious race, and form a strong contrast to their idle and debased brethren of the towns. For statistics of products, exports, and population, see ITALY and SICILY. N., in ancient times, was divided into numerous petty states independent of each other, and its inhabitants were of various races. Many of these states arose from Greek colonies, which had been founded in the country previous to the 7th c. B.C. The ancient historical importance of N. is attested by the splendour of its cities, and the warlike renown of its population. On its conquest by the Romans, the great Neapolitan cities severally adopted the municipal, federative, or colonist form of government, and gradually assimilated their laws and customs to those of their conquerors. After the downfall of the Western Empire, N. was seized by Odoacer, but soon afterwards (490 A.D.) it was subjected by the Goths, and in the following century by the Lombards, who established in it various independent duchies, as Benevento, Spoleto, Salerno, Capua, &c. Most of these were overthrown by invading bands of Arabs, Saracens, and Byzantines, who were in turn expelled, and the whole country subdued by the Normans in the 11th century. The Normans subsequently erected N. and Sicily into a kingdom, and established a new political, ecclesiastical, and military system. To the Norman

Dante and Boccaccio, the depraved libertinism of his heiress and granddaughter Joanna, the fearful ravages committed by predatory bands of German mercenaries and by the plague, the futile attempts of the Anjou sovereigns to recover Sicily, and the envenomed feuds of rival claimants to the throne, are the leading features of the history of N. during the rule of this dynasty, which expired with the profligate Joanna II. in 1435; and was followed by that of Aragon, which had ruled Sicily from the time of the Sicilian Vespers. During the tenure of the Aragon race, various unsuccessful attempts were made by the House of Anjou to recover their lost sovereignty; and the country, especially near the coast, was repeatedly ravaged by the Turks (1480). In fact, after the death of Alfonso, the first ruler of the Aragon dynasty, the country groaned under a load of misery. Wars, defensive and offensive, were incessant, the country was impoverished, and a conspiracy of the nobles to remedy the condition of affairs was productive of the most lamentable results, both to the conspirators themselves, and to the other influential Neapolitan families. In 1495, Charles VIII. invaded N., and though he was compelled to withdraw in the same year, his successor, Louis XII., with the treacherous assistance of Ferdinand (the Catholic) of Spain, succeeded in conquering the country in 1501. Two years afterwards, the Spaniards under Gonsalvo di Cordova (q. v.) drove out the French, and the country from this time became a province of Spain. Sicily had previously (1479) been annexed to the same kingdom. During the two centuries of Spanish rule in N., the parliaments which had existed from the time of the Normans fell into desuetude, the exercise of supreme authority devolved on viceroys, and to their ignorance, rapacity, and oppressive administration may be solely ascribed the unexampled misery and abasement of this period. In the words of Sismondi, 'no tax was imposed save with the apparent object of crushing commerce or destroying agriculture, and the viceregal palace and the tribunals of justice became public offices in which the highest dignities and most sacred interests of the state were openly bartered to the wealthiest bidder.' During the Spanish rule, a formidable rebellion took place in 1647, headed first by Masaniello (q. v.), and afterwards by Henry V., Duke

in N.; but a second invasion by N. ended in the proclamation of his brother-in-law, Bonaparte, as king of N.; and on this basis the Spanish crown in 1808, that of N. to Joachim Murat, brother-in-law of Napoleon. On the defeat and execution of Murat, the Bourbon monarch, Ferdinand IV., was restored. The liberal insurrectionary movements of 1821 and 1830 were the forerunners of the revolution of 1848; and in each case the party was combated by the respective kings with severity, and perfidious concessions, to and avenged with sanguinary fury by armed and credulous patriots were at the disposal of the sovereigns. See article GARIBOLDI. The ultimate overthrow of the Bourbon dynasty in the kingdom of N., and its subsequent annexation to the kingdom of Italy under King Victor Emmanuel II., see also articles FERDINAND II. and ITALY. The history of Sicily previous to its annexation to N. during its various separations from N.

**NAPLES-YELLOW** is a pigment used by artists. It consists of antimoniatic acid obtained by the direct combination of antimony acid and oxide of lead under the influence of heat.

**NAPOLÉON BONAPARTE**, Emperor of France, was born at Ajaccio, in Corsica, 15th August 1769. (For an account of his family to which he belonged, see **FAMILY OF**.) At the age of ten, he entered the Military School at Brienne, as a king's pensioner. He remained five years and a half. During this period, he displayed a great aptitude for mathematics, history, and geography, but an indifference to merely verbal and literary studies. His manner was sombre and taciturn. His schoolfellow Bourrienne (who was his schoolfellow) arose chiefly from the circumstance that he was a foreigner, poor and unaccustomed to the French, which he first learned at Brienne. In October 1784, he proceeded to the Military School to complete his studies for the army, where, in less than a year obtained his commission as lieutenant in the artillery regiment. When the Revolution broke out, N. was at Valence. He took the popular and quiet and undemonstrative way for

## NAPOLÉON BONAPARTE.

some vague design, on the part of the Directory, of invading England, and N. was appointed commander-in-chief of the invading army. It has been thought, however, that this was merely a feint to mask the real design of the Directory, viz., the invasion of Egypt, as perhaps a preliminary step to the conquest of British India. Be that as it may, an expedition against Egypt was resolved on by the Directory; and on the 19th of May 1798, N. sailed from Toulon, with a fleet containing 30,000 soldiers, and a body of savans to investigate the antiquities of the country. He reached Alexandria on the 29th of June. At this moment, France was at peace with Turkey; the invasion of Egypt, a Turkish dependency, was therefore an act utterly unjustifiable, and reminds us not of European warfare, but rather of the irruption of a horde of barbaric Tartars. N. having landed his troops, captured Alexandria, and marched on Cairo. The Mamelukes prepared resistance; but on the 21st July, at the battle of the Pyramids, they were completely defeated, and the French became, in a surface-way, masters of Egypt. N. now entered the capital, and immediately commenced to reorganise the civil and military administration of the country—for he took a great, but also an ostentatious pleasure in this sort of work. Meanwhile, on the 2d of August, Nelson had utterly destroyed the French fleet in Aboukir Bay, and so cut off N. from communication with Europe. A month later, the sultan declared war against him. This was followed by disturbances in Cairo, which were only suppressed by horrible massacres. It was obviously necessary that N. should go somewhere else. He resolved to meet the Turkish forces assembling in Syria; and in February 1799, crossed the desert at the head of 10,000 men, stormed Jaffa on the 7th March, after a heroic resistance on the part of the Turks; marched northwards by the coast, and reached Acre on the 17th. Here his career of victory was stopped. All his efforts to capture Acre were foiled through the desperate and obstinate valour of old Djezzar Pasha (q. v.), assisted by Sir Sidney Smith, with a small body of English sailors and marines. On the 21st of May, he commenced his retreat to Egypt, leaving the whole country on fire behind him, and re-entered Cairo on the 14th of June. It was during his absence that the savans made their valuable researches among the monuments of Upper Egypt. About the middle of July, the Sultan landed a force of 18,000 men at Aboukir, who were attacked by N. on the 25th, and routed with immense slaughter. But the position of the victor was far from comfortable, and he therefore resolved to return to France—especially as news had come to him of disasters in Italy and confusions in Paris. On the 23d of August, he sailed from Alexandria, leaving his army behind him, under the command of Kleber; and after narrowly escaping capture by the English fleet, landed near Frejus on the 9th October. He hastened to Paris, soon mastered the state of affairs, threw himself into the party of Sieyès, and overthrew the Directory (q. v.) on the famous 18th Brumaire. A new constitution was drawn up, chiefly by Sieyès, under which N. became First Consul, with the power of appointing to all public offices, of proposing all public measures in peace or war, and the entire command of all administrative affairs civil and military. In a word, he was ruler of France; and though far from satisfied with the clumsy machinery of Sieyès's plan, he could afford to wait the future. About the end of January 1800, he took up his residence in the Tuileries. The country was tired of revolutions, discords, and confusions; it was proud of its young leader, who seemed inspired but

not enslaved by the ideas of his age, and how to enforce obedience, as well as to principles. It therefore regarded his of sovereign power with positive satisfaction. He displayed extraordinary vigour as an administrator, recruited the national treasury, by various expedients, repealed the more violent laws during the Revolution, such as punished matters of opinion, reopened the channels terminated by policy the Vendean struggle, he knew well that his genius was essentially and that his most dazzling and influential were those won on the battle-field. Still at war with Austria, and he resolved the glories of his first Italian campaign. Moreau in command of the army of the assembled, with wonderful rapidity and army of 36,000 men on the shores of Geneva, and on the 13th May (1800) magnificent and daring march across. Almost before the Austrian general, aware, N. had entered Milan (2d June) days afterwards, was fought the fiercest yet decisive battle of Marengo, which the Austrians to resign Piedmont with tresses, and (for the second time) Lombardy to the French. Later in the year, hostilities commenced; but the Austrians, beaten by Germany (at Hohenlinden, &c.), and by 1800, were at last forced to make peace; and February 1801, signed the treaty of Lunéville, which was mainly based on that of Campo Formido. In the course of the same year, France also made peace, but the treaty (known as the Treaty of Amiens) was not definitively signed until 27th of March 1802. Not less important consolidation of affairs in France was the *Concordat* (q. v.) between N. and Pope Pius VI., which was also concluded in 1801. In January 1802, N. was elected President of the Cisalpine Republic; and on the 2d August following, was declared Consul for life by a decree of the French senate.

Meanwhile, N. was busy superintending the drawing up of a code of civil laws for France. He assembled the first lawyers in the nation, and the presidency of Cambacérès, and frequent part in their deliberations; the result of his labours were the *Code Civil des Français*, the *Code de Commerce*, the *Code de Procédure*, the *Code Penal*, and the *Code de Criminelle*, besides commercial and military codes, all of which often go loosely under the name of the *Code Napoléon*. The first of these is the most valuable production, and is in force to the present day. Considerable attention was besides paid to the branches of education as were likely to increase efficiency in the public service. Mathematical and natural science in all its departments, engineering, were as vigorously encouraged as philosophy and political speculation were discouraged. The best proof that N. wanted not an educated but only active and expert tools and the indifference that he manifested to primary and elementary education. In a population of 25 millions, the number of pupils under ten years of age was only 75,000! The internal peace was the acme of despotic centralisation. He appointed all prefects of departments, and all judges of cities, so that not a vestige of popular municipal freedom remained. He ruled the army of France, and was emperor in almost everything but the name. Peace between France and England did not long. N.'s policy in Italy irritated the government, and as remonstrances were of no avail, war was declared against France, 18th May 1803. The English fleet scoured the seas, par-

## NAPOLEON BONAPARTE.

commerce of France; while N. threatened to invade England, and assembled a large army at Boulogne. So utterly did he misconceive the character and condition of Englishmen, that he felt sure (by his own statement) he should be welcomed as a liberator by the people! While these warlike preparations were going on, occurred the dangerous conspiracy of the Chouan chief, George Cadoudal (q. v.), Pichegru (q. v.), Moreau (q. v.), and others. Its discovery (February 1804) alarmed N. excessively, and led to what has been considered one of the blackest deeds in his career—the murder of the Duke d'Enghien (q. v.) on the 20th of March following. He now appears to have felt it necessary to assume the title of emperor. France, he alleged, wanted an empire as a symbol of permanent security. An appeal was made to the nation. Upwards of 3,000,000 votes were given in favour of the proposed change in the form of government; only 3000 or 4000 against it. But where there is no municipal freedom, one does not know what value to put on votes. On the 18th May, N. assumed the title of Emperor at St Cloud, and was crowned by, or rather in the presence of, the pope (for N. rudely crowned himself), on the 2d December. In the following summer (May 26), he was also crowned king of Italy, in the great cathedral of Milan; and Eugène Beauharnais, his step-son, was appointed to the office of Viceroy.

This policy of aggrandisement, which set at naught the conditions of the treaty of Lunéville, alarmed the other nations of Europe, especially Austria, who saw her Italian possessions seriously threatened. In 1805, a coalition was formed between England, Russia, Austria, and Sweden, mainly through the persevering policy of the first of these countries; and war again broke out in the month of September. N. acted with amazing celerity. Concentrating his widely-scattered forces at Mainz, he marched at once across Bavaria, compelled General Mack to capitulate at Ulm with 20,000 men (17th October); and on the 13th of November entered the capital of Austria. France was electrified; the rest of Europe was thunder-struck. But a more glorious triumph was yet to come. The Russian army was already in Moravia, under the immediate command of the Emperor Alexander I., and was there being joined by the scattered Austrian troops. N. did not lose a moment. Hurrying north, he gave battle to the allies at Austerlitz, on the 2d of December. The contest was tremendous; but the victory was complete. N.'s opponents were utterly crushed; and next day the Austrian emperor sought an interview, and sued for peace. A treaty was signed at Presburg on the 26th December, by which Austria ceded to France all her Italian and Adriatic provinces; other changes effected by it were, the dissolution of the old German empire, and the formation of the *Confederation of the Rhine* (q. v.).

In February 1806, a French army conquered Naples, and the crown was conferred by N. on his brother Joseph; in the following June, another brother, Louis, was made king of Holland. Prussia, now, when it was too late, assumed a hostile attitude. She had hung off partly through fear and partly through selfishness, from the great anti-French coalition of the previous year, and now, when circumstances were almost hopelessly adverse, she madly rushed against her colossal enemy. Austria, with more magnanimity than prudence, lent her help, but the star of N. was still in the ascendant. The battle of Jena (October 14) absolutely annihilated the power of Prussia; five days later, N. entered Berlin, whence he issued (November 21) his celebrated 'Decrees' against British commerce, hoping to ruin her by shutting out her ships from

every harbour in Europe. His expectations, it need hardly be said, were disappointed. His policy well-nigh ruined the commerce of his own and other countries, but it only increased the prosperity of England. Her fleets and cruisers swept the seas; nothing could be got from the colonies save through her, and the merchants of the continent were obliged—in order to supply their customers as before—to let her carry on a vast contraband traffic. See **ORDERS IN COUNCIL**.

After the capture of Berlin, N. proceeded northwards to encounter the Russians, who were advancing to the help of Prussia. On his way, he summoned Poland to rise, but only with partial success. At Pultusk (December 28, 1806), and at Eylau (February 8, 1807), the French were beaten and driven back on the line of the Vistula; but after some months, he received heavy reinforcements, and on the 13th of June, fought and won the great battle of Friedland, which led to the treaty of Tilsit, signed on the 7th of July. By a secret article of this treaty, Russia promised to close her ports to British vessels. It is important to observe here, that, as the military triumphs of N. increased, the civil and political liberties of his subjects diminished. Consequent on the treaty of Tilsit, a decree of the imperial senate abolished the tribunate—the only political body in France that preserved the semblance of national self-government. In August, N. created his brother Jerome sovereign of Westphalia—having patched up a kingdom for him in his usual unscrupulous way—and soon after, entered on a war with Portugal—the beginning of the great Peninsular War. The occasion of the war was the refusal of the Prince-regent of Portugal to carry out the Berlin decree in regard to British shipping. In March 1808, occurred that extraordinary instance of trepanning at Bayonne, by which the whole royal family of Spain fell into the hands of N.; and in the following July, his 'dearly beloved brother' Joseph was ordered to exchange the throne of Naples for the 'crowns of Spain and the Indies.' His successor was the 'handsome swordsman' (*beau sabreur*), Joachim Murat. Spain rose in insurrection, and an English force, under Sir John Moore, was despatched to its assistance. N. invaded the country about the close of October, defeated the Spanish forces, and captured Madrid (4th December). But his presence was urgently needed elsewhere, and he was forced to let Soult and other generals conduct the war in the Peninsula. Austria, again irritated and alarmed at his aggressive policy, especially in Italy (where he had seized Tuscany and the States of the Church), once more prepared for war, which broke out in the spring of 1809. Her army of Germany, commanded by the Archduke Charles, was in splendid condition; but still fortune was adverse. N. hurried into Bavaria, routed the Archduke at Eckmühl (22d April), compelled him to retreat into Bohemia; and on the 12th of May, entered Vienna for the second time. But the struggle was not over. The Archduke rallied his scattered forces, worsted N. in the terrible conflicts of Aspern and Essling (21st and 22d May), and drove him to take refuge for a time on an island of the Danube. The battle of Wagram (6th July), however, once more prostrated, or at least intimidated Austria; and on the 14th of October, she signed the peace of Schönbrunn.

N. appears to have now come to the conclusion, that he could only put a stop to the hostile machinations of the old legitimate dynasties by intermarrying with some one of them. Besides, his wife Josephine had no children—and he was ambitious of perpetuating his power in his family. With that callousness to everything except his own interests,

which is a prominent feature of his character, he immediately proceeded to divorce her. The act of divorce was solemnly registered on the 16th December. Less than three months afterwards, he married Maria Louisa, Archduchess of Austria. He was now at the zenith of his power, and so, according to the old Greek belief, Nemesis was on his track. What caused his ruin was really that outrage on civilisation—the Berlin Decrees. Russia found it impossible to carry it out, without permanent injury to her great landowners; Sweden and other countries were in a similar predicament. This led to evasions of the decree, and these, again, involved Russia particularly in further complications, until finally, in May 1812, N. declared war against her; and in spite of the advice of his most prudent counsellors, resolved to invade the country. Every one knows the dreadful history of the Russian campaign. N., wringing contingents from all his allies—Germans, Austrians, Italians, Poles, and Swiss—concentrated between the Vistula and the Niemen an army of half a million of men. The vast horde crossed the latter river (24th and 25th June) in three divisions, captured Wilna (28th June), and ravaged Lithuania. The Russian generals retreated before the invading host, deliberately wasting the country, and carrying off the supplies, but avoiding, as far as possible, all engagements—their design being to surround N. in the heart of the country, and by the help of famine and the rigours of a northern winter, to annihilate him in his hour of weakness. N. followed up the retreating foe with reckless resolution. He risked everything upon the chance of striking some overwhelming blow. The horrors of his march—in Lithuania alone, 100,000 dropped off (dead, sick, or captured by the swarms of Cossacks that hung upon his flanks)—are too familiar to require description. When he reached Smolensk (16th August), the Russians had just left it—on fire! Three weeks or so later, he made up on the enemy at Borodino, where an obstinate and bloody battle was fought (7th September). The French remained in possession of the field, but of nothing else. A week after, N. entered Moscow, hoping to find rest for a time in the ancient metropolis of the country. But the city was deserted by its inhabitants; and on the 16th, a fire broke out, which raged till the 19th, and left Moscow a heap of ruins. After five weeks' stay, N. was obliged to commence his retreat (19th October). His army was reduced to 120,000 men. The winter set in much earlier than usual, and he had to return through the very districts which had been wasted on his advance. When he left Smolensk (14th November), he had only 40,000 fighting-men; when he crossed the Beresina (26th and 27th November), he had not more than 25,000. With the excuse—which was in itself no doubt true—that his presence was urgently needed in France, he now abandoned the miserable remains of his army; and, on the 5th of December, leaving Murat in command, set out in a sledge for Paris, where he arrived on the 18th of the same month. He instantly set about a fresh conscription; and in the spring of 1813, marched into Germany at the head of 350,000 men; but the Russian campaign had broken the spell of terror which his name had till then exercised. The spirit of all Europe was thoroughly roused. A conviction was—somewhat unconsciously—seizing every mind (at the close of the campaign of 1814, even France shared it), that the world had had 'enough of Bonaparte' (*assez de Bonaparte*). Prussia, in particular, was burning to wipe out the disgrace of Jena, and all the bitter humiliations to which she had been subsequently subjected. The victories of the British in Spain, the fame of which was spreading all over the continent, also proved to her that French

soldiers could be beaten, not once or twice only, but through whole campaigns. An alliance was formed between the king of Prussia and the Emperor Alexander. At first, Austria remained neutral, but afterwards she joined the coalition. N.'s military genius, it has been often remarked, never showed to greater advantage than in this and the next campaign, which cost him his crown and his liberty. He was for some months successful in winning battles—at Lützen (2d May), Bautzen (21st May), and Dresden (24th, 25th, and 27th August); but the invincible temper of the allies, who knew that he was playing his last card, made these victories almost fruitless. They were convinced that one grand defeat would neutralise all his triumphs. This was inflicted, after several minor defeats, at Leipzig—the great *Battle of Nations*, as it has been called (16th, 18th, and 19th October). The result justified their expectations—N. was hopelessly ruined! He commenced his retreat towards France, followed by the allies. When he recrossed the Rhine, he had only 70,000 or 80,000 men left out of his 350,000. All the French garrisons in the Prussian towns were compelled to surrender. N. appeared at Paris 9th November; and though great discontent prevailed in the country, and a spirit of opposition showed itself even in the legislative body, the senate decreed, at his bidding, another conscription of 300,000 men, with which N. began, in January 1814, to attempt to drive the allies out of France. The skill and energy which he displayed were extraordinary; but they only marked the intensity of his despair. On the 30th of March, the allied forces captured, after a severe engagement, the fortifications of Paris; next day, the Emperor Alexander and the king of Prussia entered the city amid the shouts of the populace; on the 4th of April, N. abdicated at Fontainebleau. He was allowed to retain the title of emperor, with the sovereignty of the island of Elba, and an income of 6,000,000 francs, to be paid by the French government. A British ship conveyed him to Elba, where he arrived on the 4th of May.

After a lapse of ten months, most of which was spent in intrigues, N. made his escape from the island, landed near Frejus on the 1st of March 1815, and appealed again to France. The army went over to him in a body, and several of his marshals, but the majority remained faithful to Louis XVIII. On the 20th of March, he reached Paris, reassumed the supreme power, promised a liberal constitution, and prepared once more to try the fortune of battle with the allies. At the head of 125,000 men, he marched (15th June) towards Charleroi, on the Flemish frontier, where the English and Prussian forces were assembling. The Duke of Wellington, who, the year before, had completed the deliverance of Spain, was appointed by the Congress of Vienna commander-in-chief of the armies of the Netherlands. The campaign lasted only a few days. On the 16th, N. defeated the Prussians, under Marshal Blücher, at Ligny, which compelled Wellington to fall back on Waterloo, where, on the 18th, was fought the most memorable and decisive battle of modern times. It resulted in the utter and irretrievable ruin of Napoleon. The despot, who knew what awaited him—for France had not recalled him from Elba; he came at the desire of a faction, whose interests were identical with his—returned to Paris. The House of Representatives fiercely insisted on his abdication. He did so (21st June) in favour of his son, Napoleon II.; they further demanded that he should leave the country for ever, and he retired to Rochefort, with the design of embarking for the United States. On the 7th July, the allies again entered Paris, and refused

## NAPOLÉON—NARCISSUS.

to acknowledge the acts of the French provisional government. N., who saw that he could not escape either by sea or land, voluntarily surrendered (15th July) to Captain Maitland of the *Bellerophon*, claiming the protection of British laws! It was, however, resolved by the British government to confine him for life on the islet of St Helena, a lonely rock in the Southern Atlantic, 1000 miles from the coast of Africa. He was conveyed thither by Admiral Cockburn, and landed at St Helena, 16th October 1815. The remainder of his life was politically insignificant. His chronic quarrels with his governor—or jailer, as the French prefer it—Sir Hudson Lowe; his conversations with friends and visitors about his past career; his deliberate attempts to falsify history in his writings, are familiar to every one. After more than a year of bad health, he expired, 5th May 1821. He was buried with military honours. In 1840, his remains were removed to France, and deposited in the *Hôtel des Invalides*.

**NAPOLÉON**, or, in full, **NAPOLÉON JOSEPH CHARLES PAUL BONAPARTE**, a French prince and general of division, is the son of Jerome, king of Westphalia, and of Frederica, Princess of Würtemberg, and was born at Trieste, in Austria, 9th September 1822. When the insurrection broke out in the Romagna in 1831, he was staying in Rome with his grandmother, Madame Letitia Bonaparte, but was forced to leave the city on account of his cousins (see **LOUIS NAPOLÉON**) being implicated in the revolutionary disturbances. He was then taken to Florence, and afterwards placed at a boarding-school in Geneva, where he remained two years, 1833–1835. His studies were completed at the Military School of Ludwigsburg, in Würtemberg, in 1840, after which he travelled for five years in Germany, England, and Spain. In 1845, he obtained from the French minister, Guizot, permission to visit Paris under the name of the Comte de Montfort; but his relations with the democratic party, and his advanced political opinions, rendered him suspected by the government, who ordered him to quit the country. He, however, again made his appearance on the eve of the revolution of February 1848. After the fall of Louis-Philippe, he offered his services to the provisional government, and was elected by the Corsicans a member of the Constituent Assembly, where he voted with the moderate republicans. He held for a short time, in 1849, the office of minister-plenipotentiary at Madrid. After the *coup d'état*, he withdrew into private life; but on the restoration of the Empire he reappeared to share in the honours that now fell thickly on his family. By a decree of the senate, 23d December 1853, he was pronounced a French prince, with the right to a place in the Senate and the Council of State; at the same time, he received the insignia of the Grand Cross of the Legion of Honour, and—though he had not served—the rank of General of Division. In the Crimean war, he commanded a division of infantry-reserves at the battles of Alma and Inkermann, but soon after returned to France, on the plea of ill-health. N. was President of the Imperial Commission of the Paris Exhibition in 1855. In 1858, he was appointed head of the ministry for Algiers and the colonies, but held the office only for a short time. During the same year he married the Princess Clotilde, daughter of Victor Emmanuel, and in the Italian war of 1859, commanded the French army of reserve in the south of Italy, but was not engaged in actual hostility. In 1861, he made a speech in the senate, reflecting on the Orleans family, for which he was challenged by the Duc d'Aumale. The challenge was not accepted, much to the disgust of the French army. N. was President of the French Commission

at the London Exhibition of 1862. In 1865, he was appointed president of the commissioners for the Paris Exhibition of 1867, but resigned this post and the vice-presidency of the privy council owing to a reprimand from the emperor about a speech. Afterwards, however, he was intrusted with many delicate missions, and urged the emperor to a liberal policy. He had no command in the late war, published a pamphlet about recent affairs—*La Vérité*—in 1871, and now resides in England.

**NARAKA** is the hell of the Hindus. Manu (q. v.) enumerates twenty-one hells or divisions of N., and gives a general description of the tortures which await the impious there. The Purāṇas, however, are more systematic. The Vishṇu-Purāṇa, for instance, not only names twenty-eight such hells, but distinctly assigns each of them to a particular class of sinners. Thus, a man who bears false witness is condemned to the hell *Raurava* (i. e., Fearful); the murderer of a Brāhman, stealer of gold, or drinker of wine, goes to the hell *Sākara* (i. e., Swine), &c. Besides these twenty-eight which the Purāṇa knows by name, we are told of 'hundreds and thousands of others in which sinners pay the penalty of their crimes.'

**NARBONNE**, a town in the south of France, in the department of Aude, 55 miles south-west of Montpellier, on a branch (La Robine) of the Canal du Midi. It is the *Narbo Martius* of the Romans; but there is reason to believe that it was well known to the Greeks 500 years before the Christian era. It was colonised by the Romans 118 B. C., and probably got the designation Martius from Q. Marcius Rex, one of the consuls at the time. Situated only about 8 miles from the sea, on the direct road into Spain and into the basin of the Garonne, N. was in early times a place of great commercial prosperity. It was the second settlement founded in South Gallia by the Romans, and was considered by them an important acquisition, both for its strength and as the key to the road into Spain. Under Tiberius, it flourished greatly; the arts and sciences being cultivated with success, and its schools rivalling for a long time those of Rome. About 309 A. D., it became the capital of Gallia Narbonensis, and contained among other buildings a capitol, theatre, forum, aqueducts, triumphal arches, &c. It was taken in 719 by the Saracens, who planted here a Moslem colony, and destroyed the churches. In 859, it fell to the arms of the Northmen. During the 11th and 12th centuries, it was a flourishing manufacturing city, but subsequently it fell into comparative decay, and is now entirely destitute of any monument of its former splendour. A considerable number of architectural fragments—as capitals, marble slabs with inscriptions, friezes, &c.—have been found, and have been grouped into a collection of antiquities.

The present very dirty town contains one imposing building, the Cathedral of St Just, founded in 1271, but still unfinished. The honey of N. is the best in France, both for colour and flavour. Manufactures are carried on to some extent. Pop. (1872) 17,266.

**NARCISSUS**, according to a Greek fable, was the son of the river god Cephissus and of the nymph Liriope or Liricessa of Thespie, in Boeotia. He was a youth of extraordinary beauty, of which he was excessively vain; and for this he was punished by Nemesis, by being made to fall in love with himself on seeing the reflection of his own face in a fountain. He died of this love-sickness; and on the place where he died, sprung up the flower which bears his name. The story of N., finely narrated by Ovid, is of comparatively late origin.

**NARWHAL** (*Monodon or Narwhalus*), a genus of Cetacea, of the family *Delphinidae*, resembling *Beluga* (q. v.) in form and in the want of a dorsal fin, but remarkably characterised by having no teeth at all, except two in the upper jaw, supposed

to be canines, which sometimes remain quaternary, even in the mature animal, as the young, and are sometimes developed in spirally twisted straight tusks, passing through upper lip, and projecting like horns in front. One species is ascertained, *M. monodon vulgaris*; the other species which have been described by naturalists having been found exaggerations and untrustworthy observations. It inhabits the Arctic seas, and is very found so far south as the Shetland Isles, as an accidental wanderer has reached the coast of England. Narwhals are often seen in great numbers among the ice-fields, and in the creeks and of the most northern coasts. They come

Narwhal (*Monodon monodon*).

associate in small herds. The tusks are more frequently developed in the male than in the female, but in the female also they sometimes attain a large size. It is but rarely that both tusks are largely developed, although they sometimes are and then diverge a little; one of them generally continues rudimentary, or attains a length only a few inches, whilst the other becomes a great projecting straight in front, from which the animal has received the name of SEA UNICORN. A male N. is generally about 15 or 16 feet in length without reckoning the tusk, which is from 6 to 10 feet long. The body is less thick than that of the Beluga; the head is small, the forehead rises abruptly, the muzzle is very obtuse, the upper jaw projects a little; the first half of the body is nearly cylindrical, the remainder to the tail fin is conical. The tusk is hollow nearly to the point. Its use is rather conjectured than known. It is probably a weapon of defence. Scoresby has suggested that it may be also used for breaking thin ice in order to obtain opportunity for respiration; and for killing fish, as found remains of skates and other flat-fish in the stomach of a N., which it is not easy to imagine how a toothless animal, with rather small mouth and lips, could capture and swallow, unless the formidable tusk were first employed. Cephalopodous molluscs, however, are believed to constitute a principal part of the food of narwhals. The N. is a very active animal, swimming with great rapidity, lively, and playful. A group of males playing together, projecting their great horns from the sea, and crossing them in their sport, is a very interesting sight. The N. is pursued by the Greenlanders and other inhabitants of the north, for

of its blubber, with which its whole body is covered to the thickness of about three inches, amounting to nearly half a ton in weight, and containing a large proportion of excellent oil. The bones are also valuable, being of an extremely com- white substance—denser, harder, and whiter than ivory—which is used as a substitute for ivory.

The kings of Denmark have long possessed a magnificent throne of this material, which is preserved in the Castle of Rosenberg. The flesh of the walrus is used by the Greenlanders as food. Great medicinal virtues were formerly ascribed to the walrus; but were merely imaginary.

**NASALIS**, or **PROBOSCIS MONKEY** (*Nasalis larvatus*), a monkey allied to the *Doucs* or *Semnopithecus*, but distinguished from all other monkeys by the extreme elongation of nose, that organ being four inches in length in the mature animal. In young, the nose is comparatively undeveloped. The nostrils are placed quite at the extremity of the nose, and are separated merely by a thin

Proboscis Monkey (*Nasalis larvatus*).

of the animal, is unknown. The *N.* inhabits the island of Sumatra and neighbouring islands. It is gregarious. An adult animal of about three feet in height, if erect, a position it does not often assume. It can leap fifteen feet or more. Its fur is thick, chestnut red, and in some places golden yellow.

**ASCENT STATE**, in Chemistry. When an element or compound is liberated from some combination in which it had previously existed, the element or compound so liberated is at the instant when it escapes said to be in a nascent state, and it is then often capable of exerting far more powerful combining action with other bodies than it can exhibit when brought in contact with them after it has been liberated. Arsenic and hydrogen will not directly combine if brought in contact with one another under ordinary circumstances, but the application of Marsh's test (see that article) depends upon the direct union of the nascent hydrogen (liberated by the decomposition of water) with the arsenic, giving rise to arseni- dous hydrogen gas. Again, if hydrated protoxide of nickel ( $\text{NiO} \cdot \text{HO}$ ) be suspended in a solution of potash ( $\text{KO} \cdot \text{HO}$ ), it will undergo no change if a current of oxygen gas be passed through the solution; but if a current of chlorine be substituted for oxygen, the whole of the metallic protoxide is converted into the brown sesquioxide

( $\text{Ni}_2\text{O}_3$ ), the resulting decomposition being shewn in the equation:

This change arises from the action of the chlorine upon the potash, during which chloride of potassium ( $\text{KCl}$ ) is formed, while the nascent oxygen which is liberated from the potash combines with the oxide of nickel. Again, cyanogen ( $\text{C}_2\text{N}$ ) and chlorine do not enter directly into combination, but if cyanogen at the instant that it is liberated from one of its compounds (as, for example, cyanide of mercury) comes in contact with chlorine, the two combine; and many other examples of similar action might be adduced.

**NA'SEBY**, a parish and village of England, in the county of Northampton, 12 miles north of the town of that name. Pop. (1871) 693. The battle of Na'seby, between Charles I. and the parliamentary army under Fairfax and Cromwell, took place here, June 14, 1645. It resulted in the total defeat of the royalists, the king being compelled to flee, after losing his cannon and baggage, and nearly 5000 of his army as prisoners.

**NASH, RICHARD**, better known by the name of *Beau Nash*, a fashionable character of the last century, who attained to a very remarkable notoriety, was the son of a Welsh gentleman, and was born at Swansea, in Glamorganshire, October 18, 1674. After studying at Oxford, he held for some time a commission in the army, and subsequently took rooms in the Temple, but the dissipation of society had more attraction for him than the pursuits of law. He became a diner-out, a frequenter of good society, and contrived to support himself by gambling. But the grand turning-point in his fortunes was his visit, in 1704, to Bath—then a favourite haunt of elegant invalids, and the scene of the gayest intrigues. N. undertook the management of the public balls, which he conducted with a splendour and decency never before witnessed. In this way he came to acquire an imperial influence in the fashionable society of the place. It appears that he was also distinguished by a species of sentimental benevolence. He played hard and successfully; yet if he heard an individual sighing behind his chair: 'Good Heavens! how happy would that money make me,' N. would thrust his own winnings into his hands, with theatrical generosity, and exclaim: 'Go, and be happy.' His own equipage at this period of his career was sumptuous. He used, we are told, to travel to Tunbridge in a post-chariot and six grays, with outriders, footmen, French-horns, and every other appendage of expensive parade. He is praised for the great care which he took of the morals of the young ladies who attended the Bath balls, always putting them on their guard against needy adventurers—like himself. In his old age, Beau N. sank into poverty, and often felt the want of that charity which he himself had never refused. He died at Bath, February 3, 1761, at the age of 87.

**NASH, JOHN**, an architect, was born in London in 1752. He underwent the usual course of training for his profession, but after practising for a few years, withdrew from it, and entered into various speculations by which he lost considerable sums. Returning to his profession, he met with great success, and in 1792 settled in London, where he speedily rose to eminence. On the strength of having obtained a patent in 1797 for improvements in the construction of the arches and piers of bridges, he was in the habit of claiming a great

notwithstanding his many defects, possessed great power of effective grouping, as is well shewn in his works. In the architecture of mansion-houses, the designing of 'interiors' was his forte.

NA'SHUA, a manufacturing city of New Hampshire, U. S., at the junction of the Merrimack and Nashua Rivers. The falls of the latter afford water-power to six large manufacturing companies, which have extensive cotton-mills, machine-shops, &c. It has 10 churches, 3 banks, 2 newspapers. Pop. (1870) 10,543.

NA'SHVILLE, a city, port of entry, and capital of Tennessee, U. S., on the Cumberland River, 200 miles above the Ohio, and a little north of the centre of the state. The river is navigable by steam-boats of 1500 tons fifty miles above Nashville. Five railways connect it with a vast and fertile country. It is a handsome, well-built city, with a state-house, which cost a million of dollars; court-house, university, hospital, custom-house, theatre, penitentiary, Free Academy, Protestant and Catholic orphan asylums, 27 churches, with numerous daily, weekly, and monthly publications. It has a large commerce, flour and planing mills, manufactories of engines and machinery, and the extensive book-publishing house of the Southern Methodists. Near the city are the State Lunatic Asylum, and the 'Hermitage,' once the residence of President Jackson. In the war of secession, N. was taken by the Federals under General Rosen- cranz, and occupied by a military governor. Pop. in 1870, 25,865.

NA'SSAU, formerly a German duchy, now Wiesbaden, a district of Prussia lying between 49° 50' and 50° 50' N. lat., and 7° 30' and 8° 45' E. long., is bounded on the W. and S. by the Main and the Rhine, the Prussian-Rhenish provinces, and the grand-duchy of Hesse; on the E. by the Hesse and Frankfort territories; and on the N. by Westphalia. Area, 1802 square miles. Pop. 468,311, at the close of 1866. The district of Wiesbaden is a compact state, possessing very great physical advantages. In its southern districts, nearly the whole of its area is occupied by the Taunus Mountains, whose highest point, the Great Feldberg, attains an elevation of about 2750 feet. This range includes within its

has few towns of any commercial importance. It boasts of many fashionable waters, which are annually crowded with visitors of the world. Of these, the most famous is Wiesbaden (q. v.), the capital of the duchy (1870) 35,463—Schwalbach, Schlangenbad, Selters, and Godesburg. Homburg, a place on the Main, is the only manufacturing town in the duchy, but a brisk trade is carried on at small ports on the Rhine, Main, &c., whence the mineral waters, wines, &c. products of the country are exported. The principal manufactures are wine—including some of the most famous in the world, such as the Hochheimer, Johannisberger, Radebrunner, Asmannshausener—copper, iron, manganese, cattle, &c.; while the principal colonial products, manufactured glass, &c.

N. had a representative form of government based on the constitution of 1814, who was also a Count-Palatine of the Rhine of Sayn, Königstein, Katzenellenbogen, &c., was assisted in the government by a prime minister, and a second chamber, chosen annually. The legislative assembly consisted of an assembly of 24 representatives, chosen annually, and a second chamber, chosen annually. One-third of the population belonged to the Church, which was under the ecclesiastical jurisdiction of the bishop of Limburg, who was a board of commissioners, located at the Rhine; and excepting about 18,000, belonged to the Jewish and other religions. The remainder of the people, including the Protestants, and were comprised under the episcopal see under the bishop of Limburg. Ample provisions were made in the constitution for popular education, in furtherance of which upwards of 700 elementary schools, 1000 teachers, 10 normal schools, various training, theological, polytechnic and other educational institutions. In 1814, by a treaty with Hanover, Göttingen was made the university for arts for Wiesbaden, a Roman Catholic theological faculty was added, and Hesse-Cassel at the university of Kassel, which is the principal

## NASSAU—NATAL.

estimated at 5,117,831 florins. The national debt at the close of 1861 represented a capital of 6,755,500 marks. The duke, who was in possession of very extensive domains, ranked as one of the richest princes of Germany.

In tracing the history of N. to its earliest origin, we find that the districts now known by that name were anciently occupied by the Alemanni, and on the subjugation of the latter people by the Franks, became incorporated first with the Frankish, and next with the German empire. Among the various chiefs who raised themselves to independent power in this portion of the Frankish territories, one of the most influential was Otto of Laurenburg, brother of King Conrad I., who became the founder of two distinct lines of princes. The heads of these lines were Walram and Otto, the sons of Count Henry I., who, in 1255, divided the land between them. Walram II., the elder, was the progenitor of the house of Laurenburg, which, towards the close of the 12th c., assumed its present name of N. from the name of its chief stronghold; while Otto, the younger, by his marriage with the heiress of Gelders, founded the line of Nassau-Gelders, whose last representative died in 1423, but which still survives through a female branch, in the family now occupying the throne of the Netherlands. This collateral branch of the house of Nassau, by inheritance in 1544, of the principality of Orange; and since that period, the representatives of the Otto line have been known as Princes of Orange (q. v.). The Walram line, which in 1292 gave an emperor to Germany, in the person of Adolf of N., was divided by the descendants of that prince into several branches, until, by the successive extinction of the other lines, the Nassau-Weilburg family, which at present reigns over the duchy, was left. In 1816, the sole heir and representative of the Walram dynasty in Germany. N. had been declared a duchy in 1806, and in 1817 the reigning duke William granted a new constitution; but during the first sittings of the assembly, dissensions arose between the ducal government and the representatives, the former having attempted to establish a proposition that the ducal domains were the conditional property of the royal house, and that the expenses of the state would consequently have to be met by taxation.

This proved a fruitful source of dissension between the duke and his people, and the opposition and discontent to which it gave rise, were not finally stayed till 1834, when a more liberal ministry, under Count Walderdorff, succeeded the unpopular cabinet which had hitherto directed public affairs. Successions were made by the ducal government, which met the requirements of the chambers, and a satisfactory compromise was effected in regard to the crown revenues. In 1836, N. joined the German *Reichs-Veren*, and subsequently to that period, it has continued to advance in material prosperity. The reigning Duke Adolphus William, who succeeded his father, Duke William, in 1839, shewed the same conservative tendencies as his predecessor. The revolutionary crisis of 1848 found the people, who had been harassed by over-government and by a gloom dread of liberal sentiments, ripe for insurrection. The peasantry rose *en masse* in the rural districts, and revenged themselves for the severity of the game-laws and other obnoxious restrictions, perpetrating the most wanton destruction of game and wood in the forests belonging to the crown and nobility. These disorders were speedily put down by the aid of federal troops, but notwithstanding the concessions made by the government, the relations between the people and their ruler

continued for many years to be unsatisfactory. Of late years there has been more unanimity between the government and the people. See GERMANY in SUPP.

NASSAU, the capital of New Providence, the principal of the Bahamas (q. v.), is pleasantly situated on the face of a hill, in lat. 25° 5' N., long. 71° 21' W. Pop. 7000. The town is well laid out, has several handsome public buildings, and an excellent harbour, drawing from 12 to 15 feet of water. The climate is very salubrious, and N. is a great resort of invalids from the north. N. exports cotton, pimento, and salt. In 1860, 219 vessels of 15,649 tons entered, and 209 vessels of 16,553 tons cleared the port. During the civil war in the United States, it became notorious in connection with the blockade-runners.

NASTURTIUM. See CRESS and TROPEOLUM.

NATAL. The region now forming the colony of Natal derives its name from its being discovered by the Portuguese on Christmas-day 1498. It was visited about 1822 by several white traders from the Cape, who found the country in possession of the Zulu chief Chaka, who ruled in a most sanguinary manner over all the tribes, from the Umzimvulu to the St Lucia River. He was killed and succeeded by his brother Dingaan in 1838, but the latter having treacherously murdered a party of emigrant Dutch Boers, who had paid him a friendly visit by invitation to buy land, he was attacked and finally destroyed by the Boers, who at that time had emigrated from the Cape Colony in large numbers, and who made his brother Panda paramount chief in his stead, and then settled themselves down in the country as his lords and masters. The British government, however, now interfered, and after a severe struggle on the part of the Boers, the country was formally proclaimed a British colony on the 12th May 1843, since which time it has progressed very satisfactorily, and bids fair to become one of the most valuable dependencies of the British crown on the African continent.

The colony of Natal looks out on the Indian Ocean, being situated on the south-east coast of Africa, about 800 miles east-north-east of the Cape of Good Hope, between the 29 and 31 parallels of south latitude. Its north-eastern boundary is the Tugela or Buffalo River, which divides it from Zululand, and its south-western boundary is the Umzimvulu, separating it from Kaffraria proper. A lofty and rugged range of mountains called the Quathamba, or Drachenberg, divide it from the Free State and Basutoland, and it contains a well-defined area of about 25,000 square miles.

These mountains are composed of a confused mass of granite, gneiss, sandstone, basaltic veins, and shale, and present both the flat top and serrated summits of the chain, of which they are a continuation, so well known in the Cape Colony as the Sneeuwberg and Stormbergen. About lat. 28° 30', these mountains seem to reach their culminating-point, and probably attain a height of 10,000 feet, forming a summit line of watershed, from which flow to all points of the compass the waters of the Orange, Umzimvubu, Vaal, Tugela, and other large South African streams. Towards the coast, these mountains present a scarped and almost inaccessible face; towards the interior, however, they gradually die away into the immense rolling plains of the Free State. Many offshoots from these mountains traverse the colony, dividing it into a series of steps or plateaux, gradually rising from the coast region to the foot of the mountains, and forming so many zones of natural productions.

The coast region, extending about 25 miles inland,

is highly fertile, and has a climate almost tropical, though perfectly healthy. Sugar, coffee, indigo, arrow-root, ginger, tobacco, and cotton thrive amazingly, and the pine-apple ripens in the open air with very little cultivation. The midland terrace is more fit for the cereals and usual European crops, while on the higher plateau, along the foot of the mountains, are immense tracts of the finest pasturage for cattle and sheep.

The climate is very salubrious; the thermometer ranges between 90° and 38°, but the heat, even in summer, is seldom oppressive. The mean temperature at Pietermaritzburg, the capital, is 3°·5 above that of Cape Town. The winter begins in April and ends in September; the average number of rainy days being 13. In the summer season the thunderstorms are very frequent and severe. The annual rainfall on the coast is about 32 inches. Inland, it varies a good deal in different districts, and is greatest in summer. The south-east is the prevailing wind here in the summer months, as in the Cape Colony. Occasionally the sirocco or hot wind from the north-west is felt, which generally terminates in a thunder-storm.

N. has but one great harbour on its coast, and that is D'Urban, or Port Natal, in lat. 29° 40'. It is completely landlocked, but a bar prevents vessels above a certain tonnage from entering. There is, however, generally a depth of water on it varying from 9 to 18 feet. There is secure holding-ground in the outer anchorage. The harbour of D'Urban is of great importance to N., as it is the only one worthy of the name on the south-east coast. Many important engineering operations are now carrying on, which, it is supposed, will considerably increase the depth of water at the entrance. The principal rivers are the Tugela or Buffalo, the Umcomanzi, Umgani, and Umzimvulu; like the majority of South African rivers, they are of no use for purposes of inland navigation; but their streams are permanent, and often available for irrigating purposes, thus giving N. in one very essential point a decided superiority over the Cape Colony.

Coal, copper-ore, iron, and other minerals are found in several places, and there is no doubt when the great mountain-range is properly explored, that it will be found very rich in mineral wealth. Large forests of valuable timber abound in the kloofs of all the mountain-ranges, and many tracts along the coast are also well wooded. N. is divided into the following counties: D'Urban and Victoria on the coast region; Pietermaritzburg, Umcomanzi, and Umooti, central; and Klip River and Weenen at foot of the mountains. The capital is Pietermaritzburg, with about 2000 inhabitants, on a tributary of the Umgani River, about 50 miles inland. It possesses three banks, a large military establishment, and many substantial public buildings. Its name is a compound of the Christian name of Pieter Rietief, and the surname of Gert Maritz, two celebrated leaders of the emigrant boers who were murdered by Dingaan. D'Urban, or Port Natal, is also a very flourishing town, having a railway connecting the landing-place at Point Natal with the town, and a population of about 1200. It has 2 newspapers, and several banks and other public institutions. Verulam, Weenen, and Ladysmith are also flourishing towns, and several other new villages have been recently formed.

N. is governed by a lieutenant-governor, nominally subordinate to, although actually independent of, the governor of the Cape, and has recently received a constitution somewhat similar to that of the Cape Colony. Municipal institutions have been granted to the principal towns. It forms the diocese of a colonial bishop, and many mission stations of the Wesleyan, American, Norwegian, and Berlin

missions exist. Education is receding, and schools are multiplying.

There are no practicable roads, except the Do Beers and Beers, which lead by a very circuitous route to the Cape Colony, rapid streams which run from the interior, communication often very difficult, and of them have as yet been bridged.

The principal articles of export are sugar and arrow-root; besides a large consumption, above 2000 tons exported during the years 1863 and 1864, than £50,000 sterling. The total in 1870 was £382,979, and is as yet comprises horses, ivory, sugar, wool, hides, feathers, molasses, horns. The value of imports in 1870. The revenue of the colony may be £111,837, principally raised from transfer dues, and taxes on native trade. In 1843, the value of imports was £1261, while the revenue was £1261, while the revenue was £1261.

N. productions were very respectable. The Great Exhibition of 1862, at the most interesting of all our exhibitions. The population of N. consists of Dutch emigrant Boers, who remain after it became a British colony, German settlers; and the remainder Zulu tribes, who originally possessed and numbered in 1869, 315,250, of which seventh were Europeans. The natives are docile and industrious of all the when properly managed, make excellent labourers.

In 1868, the total tonnage of 528,332, of which 435,370 were British. The discovery of diamonds in the Vaal River is an event in which the colony is concerned. In 1870, the value of exports was £9615; in 1871, £32,056.

The large animals are gradus, although elephants are still occasional in the dense bush of the coast region. Wolves, and hyenas still hang about the civilisation. The smaller antelope and alligators are met with in the north-east of the Umzimvulu. N. is also a poisonous snakes, produces a small which sometimes attains a length of 10 feet. The hippopotamus is still found near the rivers on the eastern frontier.

The botany of this region resembles the Cape, although generally of a more southern character. All the timber-trees of the Cape are found here, besides many new ones of the coast region, however, is the grape, at least for the purpose of wine.

The distance overland from Cape Town to Pietermaritzburg is about 1200 miles. The distance from Pietermaritzburg to Port Natal. The road between Cape Colony, along the coast, is the best, owing to the great number of rivers crossed. The distance from King'sburgh in British Kaffraria, to D'Urban is about 100 miles, and has been ridden in six days (London, 1869); Hall's *South African Almanack* (Natal, 1873).

NATAL, or RIO GRANDE, a fortified seaport of Brazil, capital of Rio Grande do Norte, and about three miles from the mouth of that name, 100 miles north of the year 1859—1860, 52 vessels entered and cleared the port. In 1860, 10,000.

## NATAL—NATIONAL CONVENTION.

**NATAL**, JOHN WILLIAM COLENSO, D.D., BISHOP OF, a divine of the Church of England, was born in 1814, and educated at St John's College, Cambridge, where he graduated as Second Wrangler and Smith's Prizeman in 1836. From 1838 to 1842, he was one of the masters of Harrow School, and for the next four years, tutor of St John's College. In 1846, he was appointed rector of Fornsett St Mary, in the county of Norfolk, and in 1854, first Bishop of N., South Africa. The works by which he was, until recently, most widely known were his two treatises on Algebra and Arithmetic. The treatise on Algebra was first published in 1849, and that on Arithmetic in 1853. They soon acquired great popularity, and have been adopted as text-books in many of the principal schools and colleges in Great Britain. He has also published other educational works. He first attracted public notice, however, by the dedication of a volume of Sermons to the Rev. Mr Maurice (q. v.), at the moment when that gentleman was in disgrace with the 'orthodox' section of the religious world. His affection and respect for Mr Maurice were further shewn by his edition of the *Communion Service, with Selections from Writings of the Rev. F. D. Maurice* (1855). In the same year appeared his *Ten Weeks in Natal*; in 1861, his *Translation of the Epistle to the Romans, commented on from a Missionary Point of View*; and *A Letter to his Grace the Archbishop of Canterbury, upon the Question of the Proper Treatment of Cases of Polygamy, as found already existing in Converts from Heathenism*, in which he recommends, on grounds both of reason and Scripture, that converts to Christianity, already possessing several wives, should not be forced to put them all away, except one. He admits that monogamy is most in harmony with the genius of Christianity, but would enforce it only in the case of those who married after their conversion. The outcry raised by his professional brethren against the *Letter* was sufficiently loud, but it was nothing to the tempest of disapprobation that burst forth in the following year (1862), when he published *The Pentateuch and Book of Joshua Critically Examined*, in which he endeavoured to prove that, as they stand, these books are not the products either of the age to which they are usually assigned, or of the authors whose names they bear; and that they are not entirely historical, but in many most important passages are overlaid with legendary, mythical, and symbolical incidents—the growth of ages, and the result of afterthought interpreting events and supplying wants. This work originated a stormy controversy, and in 1864 it was condemned by both Houses of Convocation of the province of Canterbury, and the bishop was declared to be deposed from his see. The Privy Council, on being appealed to, ruled that the deposition was invalid. In 1866, he published *Natal Sermons*, and other papers.

**NATANT**. See **NAIANT**.

**NATATOIRES** (Lat. swimmers), the name given by Illiger, and many other ornithologists, to the order of birds called *Palmipedes* (q. v.) by Cuvier.

**NATCHEZ**, a city and port of entry in Mississippi, U.S., on the east bank of the Mississippi River, 280 miles north of New Orleans. It is finely situated on the bluff, 150 feet high, which here forms the bank of the river. A portion of the town at the bottom of the bluff is called Natchez-under-the-Hill, and was formerly the resort of the river gamblers, pirates, and other desperate characters. The city has eight churches, a court-house, jail, United States Marine Hospital, and two daily papers. It is the shipping port of a large and fertile cotton district, and has steam-boat

connections with the whole Mississippi valley. N., which derives its name from a noted tribe of Indians, was settled by the French in 1716, and destroyed by the Indians in 1729, who were subsequently defeated, and banished to the West Indies. Pop. in 1870, 9057.

**NATION** (Lat. *natio*, from *natus*, born), a word used in two distinct senses. 1. A state or independent society united by common political institutions; 2. An aggregate mass of persons connected by ties of blood and lineage, and sometimes of language. The modern dogma of nationalism, as maintained by a class of continental politicians, starts from an assumption that a nation in the latter sense ought necessarily to be also a nation in the former, and endeavours to assign limits to the several races of Europe, with the view of erecting each into a distinct state, separated from other states or nationalities. The extreme politicians of the national school seem to consider the supposed rights of nationalities as paramount even to the obligations of treaties, and the political conjunction of one nationality with another is looked on by them as an adequate ground for a revolt or separation, apart altogether from the question whether the nationality is well or ill governed. In point of fact, the different races in Europe are so commingled, that any reconstruction of the political map of Europe, on ethnological principles, would be impossible, even if desirable. The blood of nine-tenths of Europe has been mixed within the historical period. The test of language, on which nationality has sometimes been based, is a deceptive one, in so far as it is indefinite and perpetually fluctuating. The people on the frontier between two races, as in the South Tyrol, generally speak two languages. Then we have dialects, like the Walloon, the Grödnérish of the Tyrol, and the Romansch of the Grisons—as also the Breton, Welsh, Gaelic, and Irish languages, which could hardly be made the basis of independent communities. The wellbeing of the people governed is properly the end of all government, and it has practically not been always found that a state is better governed when it consists of one race only, than when it includes an aggregate of races. Highly diversified nationalities may be united in one political system, provided only that the government respects and consults the peculiarities of the several races, and does not attempt to force the usages, habits, or language of one on the rest. See **ETHNOLOGY**.

**NATIONAL CONVENTION**, an assembly of deputies of the people, which assumed the whole government of France on the overthrow of the throne in 1792. When the National Assembly (see **ASSEMBLY, NATIONAL**) had decreed the suspension of the king, 10th August 1792, it appointed the election of the N. C., which commenced its sittings 21st September. Its first act was to declare France a republic, 25th September. Upon this followed the trial and condemnation of the king. Through the support of excited mobs, the extreme Jacobin party became predominant in the Convention; where, from the elevated seats on which its members sat, it received the name of the *Mountain* party. The *Revolutionary Tribunal* was established; the chief administration of affairs was intrusted to the *Committee of Public Safety*, which exercised the most despotic powers. The Girondists (q. v.), at first a powerful party in the Convention, were destroyed, many of them perishing by the guillotine; and a new constitution, thoroughly democratic, was adopted, 10th August 1793; but its operation was suspended until peace should be restored. Meanwhile, the actual rulers of the country displayed marvellous energy; almost a million of citizens being placed under arms, and

NATIONAL COVENANT. See COVENANT.

NATIONAL DEBT. See DEBT, NATIONAL.

**NATIONAL EDUCATION.** The general subject of Education has been already treated under that head. By the term 'National Education' is understood (1) the means taken by the body of any nation, either through the state or other organisations, for educating the people; (2) the objects which the nation ought to place before itself in its educational measures. These questions involve the whole inner and outer history of education, and are far too large and important to be capable of such treatment here as would convey accurate notions to the reader. All we can do is to glance slightly at the history of the two branches into which the subject divides itself. Among ancient nations, and among not a few nations now existing, education in any definite sense did not, and does not, exist for the masses of the people. The children grow up in reflective or unreflective imitation of their fathers. But at all times, nations which have quite emerged from the savage state, have had some more or less organised scheme of education for the leisured and governing classes. The purpose kept in view in such education has been to fit the pupils to discharge certain duties of war or government. In addition to this, the priesthood had the education which their traditional hymns, laws, and customs afforded. That man as such, apart from any special practical ends, should be educated, was an idea late of being recognised, and occurred first to the Greeks, to whom the world owes so much. But neither among them nor their imitators, the Romans, was the education of *the masses of the people* ever contemplated. Education, properly so called, was confined to a few. In the centuries which succeeded the introduction of Christianity, the church was the great educating body—training those intended for the service of the altar, not only in Christian doctrine, but in all the learning of the past. This, at least, was the general tendency of education in the church. But it was not till the Reformation in the 16th c. that learning, even to the limited extent of reading and writing, was considered a worthy object of pursuit by any save those who, in some form or other, were destined to be drawn within the clerical ranks.

necessity of educating *the people*—even the outcast and the criminal. In the last fifty years, all the German states, and especially Prussia and Saxony, have followed their example. In the new Kingdom of Italy are excellent national systems of education. In primary instruction; and at the secondary level in all European countries, they are the standard for the instruction and professional training of the teachers in Normal Schools for instructing the middle class. In France, *lycées*; in Germany, *Gymnasien*; in the new Kingdom of Italy, the object is to prepare pupils for the professions. They have received increased attention, and, of themselves, too, have been further developed. The curriculum extended in range, the number increased.

To return to primary instruction. In England there was no national system, before 1870, but voluntary effort by the state in the form of Public Schools. These grants were also extended to the Poor Law Schools. It became necessary to supplement these, owing to the increase of the population. The principal conditions on which the grants were made were, that they were only to supplement the existing provision, that the schools should pass a certain examination before a government inspector, that the Bible be read in them. As religious instruction might be given by the managers, no school managers pleased, but no school was established without the aid of the Privy Council. Under the stimulus afforded by the educational wants of England, to a great extent supplied; but, left unprovided with schools, as in the case of the Poor Law, badly supplied. In 1870, an Act, entitled 'An Act to provide for the better Regulation of Education in England and Wales', was passed by parliament, according to which 'there shall be provided for every district a sufficient amount of accommodated elementary schools available for a sufficient number of children resident in such district, for whose education efficient and suitable provision shall be made.' It is enacted further that the children attending these schools whose

## NATIONAL GUARD—NATURAL HISTORY.

maintained by the state exists, and one of its main features is the separation of the religious from the secular teaching—at least in theory. The extent to which this principle has been encroached upon in the course of working out the scheme, is not accurately known, but is worthy of special inquiry.

In the British colonies, as in the United States of America, adequate state systems of education have been provided on the basis of the secular principle. —Further details of the external history of primary education in England, will be found under PRIVY COUNCIL, COMMITTEE OF, ON EDUCATION.

**NATIONAL GUARD**, an armed organisation of the inhabitants of towns for local defence, differs from the British Militia and Volunteers, in that it is at the disposal of the respective municipalities rather than of the crown. From this circumstance, the National Guard has always been an eminently democratic force, dependent on the approbation of the multitude, powerful when aiding a revolt, but impotent against disturbers of tranquillity. Italy, Greece, and some other nations, have at times maintained this civic force: but the country where it arose, and whence it has derived its historic fame, is France. For a description of the celebrated French National Guard, see GARDES SUISSES.

**NATIVE**, a term much employed in Mineralogy to designate substances found as minerals, which are also, and most of them more abundantly, obtained from other minerals by chemical processes. Thus silver found pure, or nearly so, is called *Native Silver*, whilst almost all the silver used in the world is procured from ores in which it exists variously combined. The term native is more commonly applied to the metals than to any other substances.

**NA'TRON**, or **TRONA**, is a term which is employed in commerce to designate an impure sesquicarbonate of soda ( $2\text{NaO}, \text{HO}, 3\text{CO}_2 + 3\text{Aq}$ ), which always contains sulphate of soda and chloride of sodium. It is obtained from the margins of lakes in Egypt, Siberia, Tibet, &c., and from the borders of the Black and Caspian Seas.

**NATRON LAKES**. Natron was one of the substances employed, at an early period, by the ancient Egyptians for the embalming of the mummies. It was called *hesmen* by the ancient Egyptians, and, together with the lakes from whence it was derived, is mentioned in texts of the 12th dynasty, *n.c.* 1800 circa. These lakes are in the vicinity of Zakeek, a village lying west of the Damietta branch of the Nile, south of the Lake Mareotis and Alexandria. The lakes, eight in number, are below the level of the sea, and the natron is obtained by evaporation, the best called *sallance*, or royal, being crystallised almost pure. The locality is also renowned for four monasteries, Deyr Suriani, St Maiarius, Amba Bishoi, Deyr Baramoos, containing libraries of Arabic, Coptic, and Syriac MSS., many of which obtained by Archdeacon Tattam, and other travellers, have enriched the national collections with Syriac MSS. of great interest relating to theology and ecclesiastical history. Their present population is about 300, but in the time of St Pachomius, 5000 anchorites dwelt here.

Lepsius, *Todt. Taf.* vii. c. 17, l. 17; Wilkinson, *Mod. Egypt*, i. 382; Brugsch, *Wanderung nach Natron Klöstern* (12mo, Berl. 1855).

**NATTERJACK**. See TOAD.

**NATUNA ISLANDS**, THE, lie to the north-west of Borneo, between  $2^{\circ} 28'$  and  $4^{\circ} 56'$  N. lat., and  $107^{\circ} 57'$  and  $108^{\circ} 15'$  E. long. They are densely wooded and mountainous, Ranay, on Great Natuna, rising to a height of 3500 feet. The largest of the

islands is about 600 square miles. Pop. of the whole about 1300, who grow rice, maize, sago, coconuts, &c., and exchange the produce of their fishings, their sago and cocoa-nut oil, for rice, iron, and cottons, at the European settlements on the Strait of Malacca.

**NATURAL**, in Music, a note belonging to the diatonic scale of C, and neither elevated by a sharp nor depressed by a flat. When a note has been so elevated or depressed, the natural sign  $\natural$  prefixed to it on its recurrence restores it to its place on the scale. When music is written on a key with a signature of sharps or flats, it is the office of the natural sign to counteract the signature as regards the note to which it is prefixed.

**NATURAL HISTORY**, in the widest sense, includes all natural science, and has the whole of creation for its subject. In this sense the term was employed by the philosophers of antiquity. But it is now limited to those branches of science which relate to the crust of the earth and its productions. Of these, geology and mineralogy have for their subject inorganic portions of creation; botany and zoology, the various branches of which are often pursued as separate sciences, with physiology, have for their subject organised creatures. Natural history takes cognizance of the productions of nature, and of their relations to each other, with all the changes on the face of the earth, and all the phenomena of life, both animal and vegetable. It derives assistance from other sciences, particularly chemistry and natural philosophy; and some of the branches of chemistry may also be regarded as branches of natural history. When man himself is considered as a subject of scientific study, psychology must be added to the branches of natural history, but in the term as commonly employed this can scarcely be said to be included.

In every department of natural history, classification is of the utmost importance, and scarcely less important is a scientific nomenclature suited to the classification. The subjects of study are so incalculably numerous, that an arrangement of them in well-defined groups is necessary to any considerable attainment in the knowledge of them; and it is only by systems of classification which arrange smaller groups in larger, and these in larger and larger again, that natural history has been brought to its present state. The very division of natural history into different sciences is a result of such a classification, and implies a recognition of the largest and highest groups. It is not always in the establishment of these groups that the greatest difficulty is experienced. The primary distinction of all the subjects of natural history into organised and unorganised, or into those having life and those not having life, presents itself very readily to every mind. And equally natural and necessary is the distinction of organised beings into Plants and Animals, however difficult it has been found to draw the precise limit between the lowest of plants and the lowest of animals. Another distinction readily presents itself to the student of living beings, in the kinds which retain the same characters from one generation to another. But here arises one of the most important of all the questions of natural history, what a *species* is, and how it differs from a *variety*. For this we refer to the article SPECIES. But much difference of opinion as there is on this point, the common and long-prevalent notion may be assumed, as suitable enough for guidance in all that relates to classification, that those are distinct *species* which cannot by any change of circumstances—or, let it be said, by any *ordinary* change of circumstances, and within any *moderate* period of

time—be so modified as to be transmuted one into another, whilst those are only *varieties* of which the modification and transmutation can be thus effected. Thus, in botany, *Brassica oleracea* is a species, of which kale, cabbage, cauliflower, broccoli, Brussels sprouts, &c., are varieties. Species, grouped together, according to their natural affinities, form *genera* but a *genus* does not necessarily consist of more species than one; for, whilst some contain hundreds of species, others, apparently very distinct, contain only one as yet known to naturalists. The distinctions by which genera are separated are of course arbitrary, and are admitted to be so by those who deny that the distinctions between species are arbitrary, or that there is any uncertainty about them but what arises from the imperfection of our knowledge; for, at present, it must be admitted on all hands, that the uncertainty is in innumerable instances very great, what are species and what are varieties. The great object, however, in the formation of *genera* is that they shall be accordant with the facts of nature; and so in regard to the larger or higher groups which are composed of associated genera, as tribes, families, orders, classes, &c. But in all this, the great difficulty is that affinities exist on many sides; and that groups cannot be satisfactorily arranged in the order of a series, but often rather as if they radiated from a common centre; whilst otherwise viewed, the same groups might seem to radiate very differently from another common centre. A *natural system* is one framed with the utmost possible regard to all these facts; an *artificial system* fixes on one class of facts and proceeds upon it, in disregard of all others. See BOTANY.—In the inorganic departments of nature, a *species* is of course something different from what it is in the organic. But classification still proceeds on the recognition of facts in nature itself, which it is sought to exhibit in the groups that are formed. See MINERALOGY.

The nomenclature of natural history, in so far as it relates to organic beings, continues essentially as it was established by Linnæus. See GENUS. The names have in many cases been changed, but not the mode of nomenclature.

**NATURAL OBLIGATION**, in Law, means an obligation which is supposed to be prescribed by the law of nature, as the obligation of a parent to maintain his child. In England, such an obligation is not recognised by the common law, and therefore it was necessary in the Poor-Law statutes to punish by a penalty parents who, being able, refused or declined to maintain their children. In Scotland, the natural obligation of a parent to maintain his child is, however, recognised by the common law, though it is also enforced by the Poor-Law statute.

**NATURAL PHILOSOPHY** is a term frequently employed in Great Britain to designate that branch of physical science which has for its subject those properties and phenomena of bodies which are unaccompanied by any essential change in the bodies themselves. It thus includes the various sciences which are classed under *Physics* (q. v.) in the limited sense of that term.

**NATURAL THEOLOGY** is the name given to that branch of moral science which concerns itself with the evidences for the existence of God, drawn from an inquiry into the constitution of the universe. It is believed by the majority of philosophical thinkers, that these evidences warrant the belief in a Being of infinite power, wisdom, benevolence, and justice. There are, however, philosophers of great eminence who deny that there is such a thing as Natural Theology, who say that nature, at the best, gives forth an uncertain sound regarding the

existence of a Supreme Being, and demonstration of such existence is impossible. This view has always been broken down. This view is an example, both by atheists like David Hume and by the new Scots-Oxonian school of whom the principal representative is John Stuart Mill. The standard English work on the subject has been Paley's *Natural Theology* (London edition by Lord Brougham and Sir James Mackintosh, 1836). The Bridgewater and Burnet Treatises have also contributed to this branch of science.

**NATURALISATION**, the act of an alien in the position, or investing rights, of a natural-born citizen. arrangements with reference to naturalisation which the old rule that British allegiance, has been changed, are embodied in the Naturalisation Act (1870), 33 Vict. c. 14, and the Naturalisation Oath Act (1870), 33 and 34 Vict. c. 102. By the former of these statutes is provided, that an alien who has resided in the United Kingdom for a term of not less than seven years, and who has been in the service of the crown for not less than five years, and who has been naturalised, either to reside in the United Kingdom, or to serve under the crown, may, by the order of Her Majesty's Principal Secretaries of State, receive a certificate of naturalisation. The certificate is to adduce such evidence of his service, and intention to reside, or to satisfy the Secretary of State, who, without reason assigned, give or withhold the certificate. No appeal lies from his decision. A certificate takes no effect until the holder has taken the oath of allegiance. An alien who has received a certificate of naturalisation has been entitled to all political and other rights and privileges; and subject to all duties which a natural-born subject is entitled to in the United Kingdom, with this qualification, when within the limits of the foreign jurisdiction, which he was previously a subject, is a British subject, unless he has ceased to be a subject of the foreign state by the laws of that state, or a treaty to that effect. Such a certificate may be granted to any person with respect to whom no doubt exists as to his British nationality. A doubt exists, as to such a special certificate for the purpose of readmission, shall not be deemed an admission that a person to whom it was granted was not a British subject. Aliens previously naturalised, may, on application, obtain a certificate of naturalisation, if a subject who has become an alien, in this act (see ALIEN), may apply for a certificate of readmission to British nationality on the conditions as an alien by birth. The Naturalisation Act, in this case, the same discretion of readmission is likewise required, like that of admission to British nationality, requires that the recipient should not be a subject of the foreign state, the colonies, the powers of the Secretary of State are conferred on the governor. By the Naturalisation Act, 33 and 34 Vict. c. 102, a person making or subscribing a false declaration is declared to be guilty of a misdemeanor.

In France, 'La grande Naturalisation' gives all the political privileges; 'La petite Naturalisation' gives all the private rights of a Frenchman. It has been doubted whether even political rights were not included in it. In 1867, the French Government reduced from ten years to five the period during which a subject of France loses his native nationality if he naturalises in a foreign country, or if he goes abroad without permission of the Government, or even by establishing himself permanently abroad.

country. He may recover his rights by renunciation of his foreign office or domicile.

In Prussia, the higher administrative authorities naturalise any stranger who satisfies them as to his conduct and means of subsistence. Nomination by a public office confers naturalisation. Prussian nationality is lost—(a) by discharge upon the subject's request; (b) by sentence of the competent authority; (c) by living ten years in a foreign country; (d) by marriage of a female subject with a foreigner.

In Austria, the authorities may confer the rights of citizenship on a person, after ten years' residence within the empire, who has been allowed to exercise a profession. A public functionary becomes thereby invested with rights of citizenship; but admission into the army has not this effect.—In the kingdom of the Netherlands, the power of naturalising rests in the crown.—In Russia, naturalisation is effected by taking an oath of allegiance to the emperor.

In the American States, five years' residence, and declaration of intention to become a citizen, admitted before a magistrate, is requisite to naturalisation. See *Report of Royal Commissioners on Naturalisation* (1869).

**NATURALISED.** In the language of botanists and zoologists, those plants and animals are said to be naturalised in any country, which, having been introduced into it by man, have established themselves as to exist without his care. A plant or animal never said to be naturalised so long as it exists merely in a state of cultivation or domestication, it is so when it becomes truly wild, and, unaided, competes successfully for a place among those which are indigenous to the country. Thus, the horse is naturalised in Britain, or in most of the countries in which it is most highly valued; but both the horse and the ox may be said to be naturalised in South America.

Many of the plants now most characteristic of Southern Europe, are sometimes said to have been originally introduced from the East; and some that are abundant in many parts of Britain were in all probability brought from the continent of Europe. Some of these almost evince their foreign origin by growing chiefly near ruins, in places which have long been the seats of human habitation. Many plants now naturalised in Britain appear to have been originally brought for medicinal use, although now disregarded. In many cases, however, naturalisation has taken place without any attempt having ever been made by man to introduce the plant even for cultivation; thus many European weeds are now common in America, the seeds having found their way thither with those of more valuable plants, or in some such accidental manner. The same thing has taken place with animals. Thus, mice and rats find their way from one country to another; thus the bed-bug and its way at no remote date to Britain; other insects have been even more recently introduced with foreign productions of different kinds; and mollusc (see DREISSENA), previously unknown, has established itself in some British rivers and canals. The pheasant may be mentioned as an instance of naturalisation in Britain, designed and successfully accomplished by man. An *Acclimatisation Society* recently been formed in London, which has for its object the naturalising, rather than what may be strictly the acclimatising, of animals deemed suitable and desirable. It is unquestionable that much may be done by naturalisation of animals, not only to render rural scenes more attractive, but also to increase their economical productiveness. Perhaps nothing of this kind has received so little of the attention due to its importance as the naturalisation of fishes. See **ICHTHYOCULTURE**.

**NATURE-PRINTING.** This is a process by which engravings or plates answering thereto are produced by taking impressions of the objects themselves, and printing from them. There is some dispute as to the original inventor of this art; Denmark claims it for a native of Copenhagen, Peter Kyle, a goldsmith, who died about 1833, leaving the MS. description of his invention in the archives of the Royal Collection of Engravings in that capital. It is, however, admitted that no use was made of his invention. In 1853, Alois Auer, director of the State printing establishment of the Austrian empire, published his process, and also some very beautiful works illustrated by this art. About the same time, in this country, Mr G. W. Aitkin made known his discovery of an exactly similar process, and shewed some very beautiful plates of feathers, ferns, &c. But whatever other claims may be advanced, it is certain that Alois Auer holds undisputed right to the title of original inventor and practical applier of the invention. The process is very simple, as practised by Auer; but it cannot be applied to any objects except those with tolerably flat surfaces, such as dried and pressed plants, embroidery and lace, and a very few animal productions. The object is placed between a plate of copper and another of lead, both worked smooth, and polished; they are drawn through a pair of rollers, under considerable pressure—Mr Auer says forty to fifty tons; then, when the plates are separated, it is found that a most beautiful and perfect impression of the object has been made in the leaden plate. This may be used directly as an engraved plate, if only a very few impressions are wanted; but as it is too soft to resist the action of the press for practical purposes, a fac-simile of it is obtained in copper by the electrotype process, which is used as the printing-plate. The best practical use to which nature-printing has yet been applied is the multiplication of patterns of lace and other figured surfaces, either in textile materials or metals, for trade purposes. Lace-prints especially are so exactly like the originals, that the most fastidious can require nothing more; hence the cutting up of valuable pieces of lace for patterns has been saved. The late Mr Henry Bradbury, of the firm of Bradbury and Evans, London, made nature-printing his special study, and produced the exquisite works, *Nature-printed Ferns*, and *Nature-printed Sea-Weeds*, in two vols. each. London: Bradbury and Evans.

**NAUMA'CHIA**, a Greek word, signifying literally a naval battle, afterwards, among the Romans, a spectacle which consisted in the imitation of a naval battle. Julius Cæsar was the first to introduce a naumachia into Rome, 46 B.C., causing a portion of the Campus Martius to be dug to form a lake, on which the 'spectacle' came off. Augustus made an artificial lake (*stagnum*) near the Tiber for the same purpose, which was afterwards frequently used for naumachia. Claudius also exhibited a splendid one on Lake Fucinus. Nero, Domitian, and others were likewise fond of such amusements. The combatants were termed *Naumacharii*; they were for the most part either captives or condemned criminals; and the rival fleets took their names from the famous maritime nations of antiquity: Tyrians and Egyptians, Rhodians and Sicilians, Persians and Athenians, Coreyreans and Corinthians, Athenians and Syracusans. The magnificence of these spectacles may be estimated from the fact, that in the one exhibited on Lake Fucinus, 19,000 men were engaged. These *naumachia* were not *sham-fights*, any more than ordinary gladiatorial combats. Both sides fought on in real earnest for dear life until one was utterly

**NAUPLIA**, a small fortified town and seaport in the Morea, Greece, at the northern extremity of the Gulf of Argos or Nauplia, and 7 miles south-east of the town of Argos. It is laid out in the manner of a European town. Its roadstead is one of the best in Greece. In the Church of St Spiridion, Capo d'Istria was assassinated in 1831. N. is of high antiquity. At an early period it was the port and arsenal of Argos. In the 13th c., it was occupied by the Venetians, and was taken by the Turks in 1540. From 1824 to 1835, it was the capital of Greece, and had a population of upwards of 12,000; but on the removal of the court to Athens, it fell into decay. Pop. about 4000.

**NAUSEA** is a distressing sensation always referred to the stomach. It is unattended by pain, but is usually accompanied by a feeling of general languor or debility, a small and often irregular pulse, a pale, cool, and moist skin, general muscular relaxation, an increased flow of saliva, and a sensation that vomiting will supervene. It is most commonly a *direct* symptom of disease or disorder of the stomach, but sometimes it is a very important *indirect* symptom of disease of some part at a distance from the stomach—as, for example, the brain or the kidney. The nausea which is so troublesome to pregnant women is due to the irritation excited by the enlarged uterus being reflected by nervous agency to the stomach.

**NAUTÆ, CAUPONÆ, &c.** These words are the commencement of an edict in Roman law, which made shipmasters, innkeepers, and stablers liable for the safety of the goods brought into the ship, inn, or stable. The same doctrine is adopted by the common law of England and Scotland, subject to variations produced by the Carriers' Act, and Railway and Canal Traffic Act, so far as regards carriers and railway and canal companies.

**NAUTICAL ALMANAC**, a work projected for the special behoof of astronomers and navigators. See **ALMANAC**. It is chiefly valuable to the latter class from its containing tables of the 'lunar distances'—i. e., distances of the moon from a few (5 to 7) of the more prominent stars, given for every three hours throughout the year—by which, at the present day, longitudes (see **LATITUDE AND LONGITUDE**) are most conveniently and accurately deter-

Hebrides in 1829, was submitted to of Professor Owen, and became a valuable memoir by him. The long been common enough in plentifully found, entire or in fragments on tropical shores; but from the state could be learned concerning the animal to which it belonged. The shell is spiral, the aperture elevated; and thus, in external form, it resembles the shells of many species of snail; but it is *camerated*, or divided into chambers by curved partitions of shelly matter. In the present state, this structure does not expand as the animal increases in size, it deserts the shell, which then becomes an empty space, so proceeds from one to another, leaving the outermost only, but retaining the connection with all by means of a membranous tube which passes through the centre of the shell. The use of this connection is not the most probable supposition is, that the animal, enabled, by throwing air or some other substance into the empty chambers of the shell, to change the total weight of the animal, rise or sink in the water at pleasure. It inhabits the bottom of the sea, and is about, probably like the gastropod, a large muscular disc with which the animal is connected, but it sometimes rises to the surface and is seen floating there. Dr Bennett has a specimen which he fortunately caught, and has drawn his attention when thus floating, as if it were a dead tortoise-shell cat. The animal, spreading a sail is as fabulous as the story of the argonaut. The head is protruded from the shell, and can be retracted within it. There are many species attached to the head, nineteen in number; there are also numerous species of tentacles, but none of these organs are furnished with suckers, and they are feeble in comparison with the sucking organs of many of the higher cephalopods. The mouth is of the same form, as in the other cephalopods; but the jaws are not entirely composed of horn, the extremities being calcareous and of a different texture, and are differently adapted for breaking shells, also notched and sharp, and adapted

## NAUVOO—NAVAL RESERVE.

of the East Indies and South Sea Islands; it is also made into ornaments of various kinds in China and elsewhere. The animal is eaten by the Fijians and other South Sea islanders, and is much esteemed as an article of food. The Fijians capture it by means of a basket-trap, somewhat like those used for catching lobsters, baited with boiled crayfish.

The name *PAPER N.* has sometimes been given to the Argonaut (q. v.).

*Fossil Nautilus.*—About one hundred and fifty species of fossil shells have been referred to this genus. They occur in all the strata from the Upper Silurian to the most recent deposits. Numerous forms, however, which exhibit very wide differences, have been incongruously associated under this generic name. The palæozoic nautili are so remarkable, that they must certainly be referred to one or more separate genera: some of the carboniferous species have a square back, and the whorls either compact or open in the centre, while the last chamber is more or less disunited from the shell; and the Devonian Clymenia has angular sutures and an internal siphuncle. Until a careful revision of this section of the Cephalopoda is made, it will be better to consider the species as belonging to the family *Nautilidae*, and not to the genus *Nautilus*.

**NAUVOO**, a town in Illinois, United States of America, on the east bank of the Mississippi River, 220 miles above St. Louis. It was built by the Mormons in 1840, and in 1846 contained a population of 15,000. Its principal feature was a great temple of polished marble, original in style, and imposing in appearance. After the murder of Joseph Smith, the Mormon prophet (see **MORMONS**), and the expulsion of his followers, the temple was burned. The town was afterwards bought and occupied by a French Socialist community, under the leadership of M. Cabet. This experiment having proved, like others, a failure, the once famous city has been reduced to an inconsiderable village.

**NAVAL ARCHITECTURE.** See **SHIP-BUILDING**.

**NAVAL CADETS** are the youths training for service as naval officers. Every admiral on hoisting his flag may nominate two, every captain one cadet. The boy must be over twelve and under fourteen years of age, and must prove that he has had a fair elementary education. After two years' service, he becomes eligible for Midshipman (q. v.). In time of peace, about 190 cadets are annually required for the navy.

**NAVAL CROWN**, in Heraldry, a rim of gold round which are placed alternately prows of galleys and square sails. The device is said to have originated with the Roman emperor Claudius, who, after the conquest of Britain, instituted it as a reward for maritime services. He who first boarded the enemy's ship, and was the occasion of its being captured, was entitled to a naval crown. A naval crown supporting the crest in place of a wreath, occurs in various grants of arms in the early part of the present century, to the naval heroes of the late war. The crest of the Earl of

Naval Crown.

St Vincent, bestowed on him after his victory over the Spanish fleet in 1797, is issuing out of a naval crown or, enwrapped by a wreath of laurel vert, a demi-pegasus argent maned and hooped of the first and winged azure, charged in the wing with a fleur-de-lis or.

**NAVAL RESERVE, ROYAL**, is a sort of militia, auxiliary to the royal navy. It is a force held in

high esteem by naval men; and is considered an extremely valuable reserve of trained men ready to man the fleet in case of emergency. The force was instituted in 1859, under the Act 22 and 23 Vict. c. 40. That act authorises the engagement of 30,000 men, each for a period of five years, and provides that each shall be trained, for 28 days in every year, to the use of arms and naval tactics, either in Her Majesty's ships or on shore. In case of national emergency, these men can, by royal proclamation, be called out for service in the navy in any part of the world, for periods not exceeding five years. While training and while called out for actual service, the men receive the same wages as corresponding ratings in the royal navy: in addition, they each receive, as retaining fee, a sum of six pounds for every year in which the regulated training has been completed. On actual service, after three years—whether of uninterrupted service, or at broken intervals—the volunteer becomes entitled to twopence extra per diem. The man can terminate his engagement at the end of five years, unless on actual service, when the Queen may require him to complete five years of such service before discharging him. During the continuance of his engagement, he must not embark on voyages which shall entail a longer absence from the United Kingdom than six months, unless with special permission of the Admiralty. The periods for training are made as far as practicable to suit the sailor's convenience: he may break the 28 days into shorter periods, none being less than seven days. He is drilled as near as practicable to his own home, the drilling being intrusted to the officers of the Coast-guard. While drilling, if on board a Queen's ship, he has the regulation victuals; if billeted on shore, while training for great-gun exercise in batteries, he is allowed 1s. 4d. a day for victuals. It is optional with the volunteer to renew his engagement from time to time, as the respective periods of five years expire; and at about the age of 45, he becomes entitled to a pension of £12 or upwards for the rest of his life, subject to the usual obligation of service in certain circumstances in the navy, which all pensioners are under. This pension may be commuted, if desired, into one of less amount, to last until the death of the longest liver of the volunteer and his wife.

To be eligible for the Royal Naval Reserve, a man must be a British subject, under 35 years of age, in good health, and, within the preceding ten years, must have served at least five years at sea, of which one year shall have been as able seaman. Soldiers, militiamen, and Coast Volunteers are ineligible, and subject to a penalty if they join; but a member of the last force may obtain his discharge therefrom for the purpose of joining the Naval Reserve. Penalties are enacted in case men fail to attend: and failure after proper notice to come up for actual service is held equivalent to desertion. While training or on duty, the men are liable to all the punishments, as they are entitled to all the rights and privileges of regular seamen. The men considered most desirable are (1) those having fixed residences, and personally known to the shipping-master or his deputies; and (2) men having regular employment in the coasting-trade, or in vessels the business of which brings them back to the same ports at frequent and known intervals. In 1874, about 15,000 men belonged to the Naval Reserve, and were in a state of great efficiency.

In 1861, the system of the Reserve was extended—by the Act 24 and 25 Vict. c. 129—to officers of the merchant-service, certificated masters and mates being respectively granted commissions in the Naval Reserve as lieutenants and sub-lieutenants. The

Drogheda, and also by the Meath Railway. Pop. (1871) 4104, of whom 3862 were Catholics, 130 Protestant Episcopalians, and the rest Protestants of other denominations. N. is one of the most ancient boroughs of English foundation in Ireland, and previous to the Union, returned two members to the Irish parliament. It is a place of considerable inland trade, and possesses a flax mill, several flour-mills, and two paper-mills, besides a tannery, a brewery, and two distilleries. There are also an endowed school, a Roman Catholic seminary (one of the first opened in Ireland after the repeal of the penal law), and three national schools, containing (1871) 647 pupils, of whom 166 were boys, and 481 girls. The girls' school is attached to the Roman Catholic convent.

**NAVARINO**, or Neo-Castro, a seaport and citadel on the south-west coast of the Morea in Greece, contains only 2000 inhabitants, but is of importance from its position, commanding the entrance of the Bay of Navarino, at the southern extremity of which it is situated. On the island of Sphagia or Sphacteria, which closes the bay's mouth, was formerly situated Pylus Messeniaca, the town of Nestor, in a spot where now stands Old Navarino or Palæocastron. The Bay of Navarino was the scene of a great sea-fight between the Athenians under Cleon, and the Spartans (425 B.C.), in which the latter were defeated; and on the 20th October 1827, it saw the annihilation of the Turkish and Egyptian navies by the combined British, French, and Russian fleets under Sir Edward Codrington.

**NAVARRÉ**, a province, and formerly a kingdom of Spain, is bounded on the N. by France, on the S. and E. by Aragon, and on the W. by the Biscays; and is situated in 42° 20'—43° 15' N. lat., and 0° 50'—2° 30' W. long. Area about 4000 square miles. Pop. in 1867, 316,340. The country is mountainous, being bounded and traversed by the Pyrenees, spurs of which occupy almost the whole of the province in its northern and eastern parts. The highest peaks are Altovisear, Adi, Alcorrunz, and Ruña. N. is watered by the Bidassoa, the Anezo, and by the Ebro, together with its tributaries, the Ega and Aragon, on the level shores of which corn, wine, and oil of good quality are pro-

duced with superstitious devotion. The population is intermarried chiefly among themselves, and are a nearly pure Basque race. In mountainous districts, Basque is still spoken, but in the plains, the modern Castilian form is rapidly supplanting the ancient language. The chief town is Pamplona.

The territory known from an early period in Spanish history under the name of Vasconia, in ancient times by the Vascones, and by the Goths in the 5th century, became gradually amalgamated with the people continued to enjoy a special independence under military leaders when they were almost annihilated by the Arabs who were rapidly spreading to all parts of the peninsula. The people of N., who had been converted to Christianity, offered a gallant resistance to their Moslem conquerors, and although repeatedly beaten, wholly subdued. The remnant with the sword of their Moslem enemies to the fastnesses of the mountains, and of their number, Garcia Ximenes, a king, they sallied forth, and by the aid of the Christians, compelled the Arabs to leave the country. The enjoyment of an independence great as the neighbouring states. On the death of Ximenes, in the middle of the 10th century, Navarrese elected as their king, Count of Bigorre, in whose family the crown remained till the marriage of Philip II. of France and Queen Joanna I. of N.; and the latter, after the death of her husband, former to the throne of France in 1518, was an appanage of the crown of France, and a part of that kingdom during the reigns of Louis X., Philip V., and Charles VI. The death of this last in 1328, from the family of Valois, and the daughter, Isabella, rightful heir, succeeded to N. as queen. The events of the kingdom present little interest during the next hundred years, the marriage of Blanche, daughter of N., with John II. of Aragon, in 1479, led to the annexation of N. to Aragon, and suffered his wife to rule her own kingdom. After her death, in 1505, on her second re-marriage, he resigned the crown of N. to his son, Philip I., who was married to Isabella, daughter of N., and by her became king of Castile and Aragon.

in 1483. Ferdinand and Isabella sought to marry the young queen to their son and heir, the Prince of Asturias, but her mother, a French princess, married her to Jean d'Albret. Ferdinand, however, was not willing to let the prize escape him, and on some slight pretext he seized N. in 1512. After this act of spoliation, there remained nothing of ancient N. beyond a small territory on the northern side of the Pyrenees, which was subsequently united to the crown of France by Henri IV. of Bourbon, King of N., whose mother, Jeanne d'Albret, was granddaughter of Queen Catharine; and hence the history of N. ends with his accession to the French throne in 1589. The Navarrese were, however, permitted to retain many of their ancient municipal charters and constitutional privileges, after their incorporation with the other domains of the Spanish crown, and these prerogatives were not taken from them till the reign of the present queen, when the active aid which they had furnished to the Pretender, Don Carlos, drew upon them the ill-will of the government, and led, at the close of the Carlist war, to the abrogation of their *fueros*, or national assemblies, and to the amalgamation of their nationality with that of the kingdom at large.

NAVE. See CHURCH.

NA'VEW (Fr. *Navette*), a garden vegetable, much cultivated in France and other parts of the continent of Europe, although little used in Britain. It is by some botanists regarded as a cultivated variety of *Brassica napus*, or Rape (q. v.), whilst others refer it to *B. campestris*, sometimes therefore called Wild N., the species which is also supposed to be the original of the Swedish Turnip (q. v.). The part used is the swollen root, as in the turnip, but it is rather like a carrot in shape. Its colour is white. Its flavour is much stronger than that of the turnip. It succeeds in any soil, but is of best quality in a dry light soil. The seed is sown in spring, and the plants thinned out to five inches apart.

NAVICULA (Lat. a little ship), a genus of *Diatomaceæ* (q. v.), receiving its name from the resemblance of its form to that of a boat. Some of the species are very common.

NAVICULAR DISEASE, in the Horse, consists in strain of the strong flexor tendon of the foot, at the point within the hollow of the fetlock, where it passes over the navicular bone. It is most common amongst the lighter sorts of horses, and especially where they have upright pasterns, out-turned toes, and early severe work on hard roads. It soon gives rise to a short tripping yet cautious gait, undue wear of the toe of the shoe, wasting of the muscles of the shoulder, and projecting or 'pointing' of the affected limb whilst standing. When early noticed, and in horses with well-formed legs, it is often curable; but when of several weeks' standing, it leads to so much inflammation and destruction of the tendon and adjoining parts, that soundness and fitness for fast work are again impossible. Rest should at once be given, the shoe removed, the toe shortened, and the foot placed in a large, soft, hot poultice, changed every few hours. Laxative medicine and bran mashes should be ordered, and a soft bed made with old short litter. After a few days, and when the heat and tenderness abate, cold applications should supersede the hot; and, after another week, a blister may be applied round the coronet, and the animal placed for two months in a good yard or in a grass field, if the ground be soft and moist; or, if sufficiently strong, at slow farm-work on soft land. Division of the nerve going to the foot removes sensation, and consequently lameness; and

hence is useful in relieving animals intended for breeding purposes or for slow work. The operation, however, is not to be recommended where fast work is required; for the animal, insensible to pain, uses the limb as if nothing were amiss, and the disease rapidly becomes worse.

NAVIES, ANCIENT AND MEDIEVAL. The ancient method of naval warfare consisted, in great part, in the driving of *beaked* vessels against each other; and therefore skill and celerity in manœuvring, so as to strike the enemy at the greatest disadvantage, were of the utmost importance. The victory thus usually remained with the best sailor. This mode of conflict has been attempted to be revived at the present time, and vessels called 'steam-rams' are specially constructed for this species of conflict. The earliest powers having efficient fleets appear to have been the Phœnicians, Carthaginians, Persians, and Greeks; the Greeks had fleets as early as the beginning of the 7th c. B. C.—the first sea-fight on record being that between the Corinthians and their colonists of Corcyra, 664 B. C. The earliest great battle in which tactics appear to have distinctly been opposed to superior force, and with success, was that of Salamis (480 B. C.), where Themistocles, taking advantage of the narrows, forced the Persian fleet of Xerxes to combat in such a manner, that their line of battle but little exceeded in length the line of the much inferior Athenian fleet. The Peloponnesian War, where 'Greek met Greek,' tended much to develop the art of naval warfare. But the destruction of the Athenian marine power in the Syracusan expedition of 414 B. C., left Carthage mistress of the Mediterranean. The Roman power, however, gradually asserted itself, and after two centuries, became omnipotent by the destruction of Carthage. For several following centuries, the only sea-fights were occasioned by the civil wars of the Romans. Towards the close of the empire, the system of fighting with pointed prows had been discontinued in favour of that which had always co-existed—viz., the running alongside, and boarding by armed men, with whom each vessel was overloaded. Onagers, baliste, &c. were ultimately carried in the ships, and used as artillery; but they were little relied on, and it was usual, after a discharge of arrows and javelins, to come to close quarters. A sea-fight was therefore a hand-to-hand struggle on a floating base, in which the vanquished were almost certainly drowned or slain.

The northern invaders of the empire, and subsequently the Moors, seem to have introduced swift-sailing galleys, warring in small squadrons and singly, and ravaging all civilised coasts for plunder and slaves. This—the break-up of the empire—was the era of piracy, when every nation, which had more to win than lose by freebooting, sent out its cruisers. Foremost for daring and seamanship were the Norsemen, who penetrated in every direction from the Bosphorus to Newfoundland. Combination being the only security against these marauders, the medieval navies gradually sprang up; the most conspicuous being—in the Mediterranean, those of Venice, Genoa, Pisa, Aragon; on the Atlantic sea-board, England and France. In the Mediterranean, Venice, after a long struggle with the Genoese, and subsequently with the Turks, became the great naval power. The Aragonese fleet gradually developed into the Spanish navy, which, by the epoch of Columbus, had a rival in that of Portugal. Many struggles left, in the 16th and 17th centuries, the principal naval power in the hands of the English, French, Dutch, Spaniards, and Portuguese. The present state of these and other existing navies will be briefly given under NAVIES, MODERN.

# NAVIES—NAVIGATION.

**NAVIES, MODERN.** Dating the modern navies of the world from the 16th c., we find the British navy rising from insignificance by the destruction of the Spanish Armada in 1588; a blow which Spain never recovered, and which the Dutch, whose naval force had acquired tremendous strength in their struggle for independence, increased the weight of, by their triumph in 1607, in the Bay of Gibraltar. At this time, there was no decisive superiority of the fleet of England over that of France; but each was inferior to the Dutch navy. The Commonwealth and reign of Charles II. were signalised by the struggle for mastery between the English and Dutch; when victory, after many alternations, finally sided with the former. Through the 18th c., the English and French were the principal fleets; but Louis XVI. gave a decided superiority to the navy of France; and at the period of the American War, the naval power of England was seriously threatened. Spain, Holland, and Russia (now for the first time a naval power) had meanwhile acquired considerable fleets; and the 'armed neutrality,' to which the northern powers gave their adherence, rendered the British position most critical. However, the slowly roused energy of her

government, the invincible courage of her admirals, and the genius of her admirals, brought through all her trials. Camperdown 1794, Dutch power; many battles weakened the navy; and at Trafalgar, in 1805, it, Spanish power, was swept from the ocean. The United States had in the meantime augmented her fleet, and in the war of 1812—1814, made a glorious struggle; but their navy is distinguished rather for the power of its individual ships than the number of vessels. The growth, in respect of the British navy will be found under the heading BRITISH. The Emperor Napoleon III. greatly enlarged and improved the French navy, which was not very inferior to that of England. During the American War of Secession, a vast fleet of iron-clad vessels, 'monitors,' and iron-clad vessels of a new type was created; but the ships appear chiefly adapted for river and coast service.

The following table, shewing the principal statistics of the several countries, is compiled from the latest returns; but these returns are in such varying forms, and are so incomplete in cases, that comparison is difficult:

**NAVIGATION, HISTORY OF.** In its widest sense, this subject is divisible into three sections—the history of the progressive improvement in the construction of ships, the history of the growth of naval powers, and the history of the gradual spread and increase of the science of navigation. Although these three sections are to some extent interwoven, the present article will be limited to a consideration of the last, the first two being sufficiently described under SHIP-BUILDING, and NAVIES.

The first use of ships, as distinguished from boats, appears to have been by the early Egyptians, who are believed to have reached the western coast of India, besides navigating the Mediterranean. Little, however, is known of their prowess on the waves; and, whatever it may have been, they were soon eclipsed by the citizens of Tyre, who, to make amends for the unproductiveness of their strip of territory, laid the seas under tribute, and made their city the great emporium of Eastern and European trade. They spread their merchant fleets throughout the Mediterranean, navigated Solomon's squadrons

to the Persian Gulf and Indian Ocean, and planted colonies everywhere. Principal among them was Carthage, which soon outshone the parent in its maritime daring. The Carthaginians passed the Pillars of Hercules, and, with no guide than the stars, are believed to have sailed northward to the British Isles, and thence some distance along the west coast of Europe. From the 6th to the 4th centuries B.C., the states gradually developed the art of navigation, and at the time of the Peloponnesian war, the Carthaginians appear to have been skilful tacticians, and of concerted manœuvres. The Greeks, however, were rather warlike than commercial in their naval affairs. In the 4th c. B.C., Alexander destroyed the Tyrian power, transferring its commerce to Alexandria, which, having an admirable harbour, became the centre of trade for the ancient world, and far surpassed in the magnitude of its transactions any city which had yet existed. It next wrested from Carthage its naval power, and took its vast trade into the hands of the

## NAVIGATION.

sailors. After the battle of Actium, Egypt became a Roman province, and Augustus was master of the enormous commerce both of the Roman and the Alexandrian merchants. During all this period, the size of the vessels had been continually increasing, but probably the form was that of the galley, still common in the Mediterranean, though a more clumsy craft then than now. Sails were known, and some knowledge was evinced even of beating up against a foul wind; but oars were the great motive-power; speed was not thought of, a voyage from the Levant to Italy being the work of a season; and so little confidence had the sailors in their skill or in the stability of their ships (still steered by two oars projecting from the stern), that it was customary to haul the vessels up on shore when winter set in. During the empire, no great progress seems to have been made, except in the size of the vessels; but regular fleets were maintained, both in the Mediterranean and on the coast of Gaul, for the protection of commerce. Meanwhile the barbarian invasions of the north were advancing in quite a different school. The Saxon, Jutish, and Norse rows began to roam the ocean in every direction; in small vessels, they trusted more to the winds than to oars, and, sailing singly, gradually acquired that hardihood and daring which ultimately rendered them masters of the sea. The Britons were no mean seamen, and when Carausius assumed the purple in their island, he was able, for several years, by his fleets alone to maintain his independence against all the power of Rome.

The art of navigation became almost extinct in the Mediterranean with the fall of the empire; but the barbarous conquerors soon perceived its value, and revived its practice with the addition of new inventions suggested by their own energy. The Venetians of Venice, the Genoese, and the Pisans, were the carriers of that great inland sea. Their merchants traded to the furthest Indies, and their markets became the exchanges for the produce of the world. Great fleets of merchant galleys from these flourishing republics dared the storm, while their constant wars gave occasion for the growth of naval tactics. So rich a commerce tempted piracy, and the Moorish corsairs penetrated everywhere on both sides of the straits of Gibraltar in quest of prey; evincing not less skill and nautical audacity than savage fury and inhuman cruelty. But the Atlantic powers, taught in stormy seas, were rearing a naval might that should outrival all other pretenders. The Norsemen extended their voyages to Iceland, Greenland, and Newfoundland, while they first ravaged and then colonised the coasts of Britain, France, and Sicily. The sea had no terrors for these hardy rovers; their exploits are imperishably recorded in the Icelandic Sagas, and in the numerous islands and promontories to which they have given names.

Early in the 15th c., the introduction of the mariner's compass rendered the seaman independent of sun and stars—an incalculable gain, as was soon shown in the ocean-voyages of Columbus, Cabot, and others. In 1492, Columbus rendered navigation more secure by the discovery of the variation of the compass. Between that and 1514, the 'cross-staff' began to be used; a rude instrument for ascertaining the angle between the moon and a fixed star, with the consequent longitude. Early in the 16th c., tables of declination and ascension became common. In 1537, Nuñez (Nonius), a Portuguese, invented various methods of computing the rhumb-lines and sailing on the great circle. In 1545, the two first treatises on systematic navigation appeared in Spain, one by Pedro de Medina, the other by Martin Cortes. These works were speedily trans-

lated into French, Dutch, English, &c., and for many years served as the text-books of practical navigation. Towards the end of the century, Bourne in England, and Stevin in Holland, improved the astronomical portion of the art, while the introduction of time-pieces and the Log (q. v.) rendered the computation of distance more easy.

It would be tedious to enumerate the successive improvements by which the science of navigation has been brought to its present high perfection; but as conspicuous points in the history of the art, the following stand out: The invention of Mercator's chart in 1569; the formation by Wright of tables of meridional parts, 1597; Davis's quadrant, about 1600; the application of logarithms to nautical calculations, 1620, by Edmund Gunter; the introduction of middle-latitude sailing in 1623; the measure of a degree on the meridian, by Richard Norwood, in 1631. Hadley's quadrant, a century later, rendered observations easier and more accurate; while Harrison's chronometers (1764), rendered the computation of longitude a matter of comparatively small difficulty. Wright, Bond, and Norwood were the authors of scientific navigation, and their science is now made available in practice by means of the *Nautical Almanac*, published annually by the British Admiralty. The more important points of the science of navigation are noticed under such heads as DEAD-RECKONING, LATITUDE AND LONGITUDE, GREAT-CIRCLE SAILING, SAILINGS, &c.

**NAVIGATION, LAWS AS TO.** By the law of nature and of nations, the navigation of the open sea is free to all the world. The open sea means all the main seas and oceans beyond three miles from land. The sea within three miles from land is called the territorial sea, and each state has a kind of property in such sea, and has a right to regulate the use thereof. Hence, it was natural that in early times, before the laws of commerce were properly understood, each state should endeavour to exclude foreigners from that part of the sea so as to secure to its own subjects the benefits of the carriage of goods in ships, which has always been an increasing source of wealth. In England, however, as in most countries, the first care seems to have been bestowed on the navy, as the great means of defending the realm against enemies, and trading-ships came to be first subject to statutory regulation only as being in some way ancillary to the interests of the navy. The laws of Oleron were the first code of maritime laws which obtained notice as well as general acceptance in Europe, in the time of Edward I., and the authorship of those laws is claimed by Selden and Blackstone for Edward I., though the point is disputed by the French writers. By a statute of Richard II., in order to augment the navy of England, it was ordained that none of the lieges should ship any merchandise out of the realm except in native ships, though the statute was soon varied and seldom followed. At length, in 1650, an act was passed with a view to stop the gainful trade of the Dutch. It prohibited all ships of foreign nations from trading with any English plantation without a licence from the Council of State. In 1651, the prohibition was extended to the mother-country, and no goods were suffered to be imported into England or any of its dependencies in any other than English bottoms, or in the ships of that European nation of which the merchandise was the genuine growth or manufacture. At the Restoration, these enactments were repeated and continued by the Navigation Act (12 Char. II. c. 18), with the further addition, that the master and three-fourths of the mariners should also be British subjects. The object of this act was to encourage British shipping, and was long believed to be wise and

## NAVIGATORS' ISLANDS—NAVY.

salutary. Adam Smith, however, had the sagacity to see that the act was not favourable to foreign commerce or to opulence, and it was only on the ground that defence was more important than opulence, that he said it was 'perhaps the wisest of all the commercial regulations of England.' In 1826, the statute 4 Geo. IV. c. 41 repealed the Navigation Act, and established a new system of regulations, which were further varied by subsequent statutes, till, under the influence of the free-trade doctrines, new statutes were passed, which reversed the ancient policy. By the law, as now altered, foreign vessels are allowed free commercial intercourse and equality with the ships of this country and its dependencies, except as regards the coasting-trade of the British possessions in Asia, Africa, and America, for the coasting-trade of the United Kingdom is now entirely thrown open to all comers. The advantages of equality and free trade are, however, so far qualified, that in the case of the ships of those nations which do not concede to British ships like privileges, prohibitions and restrictions may be imposed by order in council.

As regards those laws of navigation which affect the property and management of ships, a complete code of regulations is contained in the Merchant Shipping Acts, which are 17 and 18 Vict. c. 104, 18 and 19 Vict. c. 91, 25 and 26 Vict. c. 63. It will be necessary only to indicate the leading divisions of this subject. 1. As to ownership, registration, and transfer of merchant-ships. No ship is deemed a British ship unless she belong wholly to natural-born subjects, denizens, naturalised persons, or bodies corporate, having a place of business in the United Kingdom or some British possession. Every British ship, with a few exceptions as to old ships and small vessels, must be registered, otherwise, it is not entitled to the protection of the British flag. The Commissioners of Customs indicate at what port in the United Kingdom ships may be registered by their officers, and when registered, the ship is held to belong to that port. The name of the ship and its owners must be stated; and as regards joint-ownership, a ship is capable only of being subdivided into sixty-four shares, and not more than thirty-two owners shall own one ship. These registered owners are deemed the legal owners, and so long as the register is unchanged, the ship is held still to belong to them. The only way of transferring the property is by a bill of sale under seal; or if a mortgage is made, it must be made in a particular form, and duly registered, and the priority of title as between several mortgagees is regulated by the date of the entry in the register. 2. As regards the laws concerning merchant seamen, there is established in every such seaport a superintendent, whose business it is to afford facilities for engaging seamen, by keeping registers of seamen and superintending the making and discharging of contracts. No person is allowed to be employed in a foreign-going ship as master, or as first, or second, or only mate, or in a home-trade passenger-ship as master, or first or only mate, unless he has a certificate of competency or a certificate of service, issued by the Board of Trade only to those who are deemed entitled thereto. The master of every ship above 80 tons burden shall enter into an agreement, of a certain form, with every seaman he carries from the United Kingdom, and in which the names of the seamen, wages, provisions, capacity of service, &c., are set forth. The seamen are not to lose their wages though no freight is earned, or the ship lost. The men are also to have a berth of a certain size, and the ship to be supplied with medicines, log-book, &c. In order to secure general information, every master of a foreign-going ship is bound, within 48 hours after

arriving at the final port of destination in the United Kingdom, to give in a list of particulars to the local superintendent of the Marine Office. 3. As regards the owners for loss or damage, it is provided that no owner of a sea-going ship shall be liable for any loss or damage to his actual fault or privity, to go on board, by reason of fire on board any gold, silver, diamonds, or precious stones on board, by reason of embezzlement, unless the true nature of such articles have been inserted in the bill of lading. And in cases where loss without his actual fault or privity shall not be liable in damages amount exceeding £8 per ton of the ship. In case of loss of life or personal mismanagement of the ship, but without fault or privity of the owners, the owner shall be liable beyond £15 per ton. In cases where a large number of persons are injured, and to prevent a multiplicity of suits, the sheriff of the county is to enquire into the question of liability, and if found liable, then £30 is to be paid for each case of death or injury. In case of death, such sum is to be paid to the husband, wife, parent, or child of the deceased; any person consider this is not sufficient, then, on returning such sum, he must action; but unless he recover damages, he must pay the costs. See also *PILGRIM HOUSES*.

**NAVIGATORS' or SAMOA' ISLANDS.** A group of nine islands, with some smaller ones, in the Pacific Ocean, lying north of the equator, in lat. 13° 30'—14° 30' S. and long. 169° 30'—171° 30' W. The four principal islands of the group are Upolu, Savaii, and Tutuila. Of Upolu, 10 miles in length by 20 miles broad, population of 20,000, is the largest; the group estimated at 2650 square miles, and about 56,000. With the exception of Upolu, the N. I. are all of volcanic origin, most part they are lofty, and broken by steep cliffs, rising in some cases to 10,000 feet in height, and covered with vegetation. The soil, formed chiefly of volcanic rock, is rich, and moist. The forests, which include fruit, the cocoa-nut, banana and many other important plants, are remarkably thick. The orange, lemon, and which a kind of sago is made), coconuts, pine-apples, yams, nutmeg, and many other important plants, &c. Until recently, when swine, horses, and horses were introduced, there were among these islands of any native species of bat. The natives (especially the males), ingenious, and industrious. The women, who superintend the manufacture of mats, are held in high esteem. The English and American mission stations, as well as several Roman Catholic missions, and many of the native population have embraced Christianity. The government is that of a chief; the supreme power is vested in a certain body of chiefs, or 'conquering party.' Trade is carried on with Sydney.

**NAVY, BRITISH.** Owing to the importance of Great Britain, her navy has long been a matter of vital importance, and in which every inhabitant takes a part.

## NAVY.

dering the history of the British navy, it is evident to divide the subject into *matériel* and *manœuvres*. The latter had no distinct organisation at the time of Henry VIII.; but of the former, we find in the earliest times the germ of subsequent glories. Carausius, a Roman general who had torn off his dependence on the empire, maintained himself in England for several years by his fleet, with which he prevented the imperial forces from reaching the island. The Saxons brought maritime prowess to the British shores, but appear soon to have lost it amid the rich provinces in which they dwelt. Some organisation for the defence of the coast was, however, maintained, and Alfred the Great availed himself of it to repulse the Danes; he at the same time raised the efficiency of his navy by increasing the size of his galleys, some being which were capable of being rowed by thirty of oars. Under his successors, the number of ships increased, and both Edward and Athelstan fought many naval battles with the Danes. Edgar was declared lord of all the northern seas, and had three to five thousand galleys, divided into three fleets on the western, southern, and eastern coasts respectively; but the size of most of these was very insignificant, and the greater part probably mere row-boats. Ethelred II. formed a militia of naval militia, enacting that every owner of a ship of land should build and furnish one for the service of his country.

William the Conqueror established the Cinque Ports, with important privileges, in return for which the portmen were bound to have at the service of the crown 5 days in any emergency, 52 ships carrying 24 guns each. Richard I. took 100 large ships and 50,000 men to Palestine. John claimed the sovereignty of the seas, and required all foreigners to strike to the English flag; a pretension which has been the cause of many bloody battles, but which England proudly maintained in all dangers. (This honour was formally acknowledged by the Dutch in 1673, and the French in 1763; and, although not now exacted in its fulness, the remembrance of the right survives in requiring foreign vessels to salute first.) In the same king's reign, a great naval engagement with the French fleet (1293) in mid-channel, when 250 French ships were captured. The Edwards and the Lancastrians maintained the glory of the British flag;

had 'grete shippes, carrakes, barges, and ballyngers;' and at one time collected vessels enough to transport 25,000 men into Normandy. Henry VII. was the first monarch who maintained a fleet during peace; he built the *Great Harry*, which was the earliest war-vessel of any size, and which was burned at Woolwich in 1553.

To Henry VIII., however, belongs the honour of having laid the foundation of the British navy as a distinct service. Besides building several large vessels, of which the *Henry Grace de Dieu*, of 72 guns, 700 men, and probably about 1000 tons, was the most considerable, he constituted a permanent personnel, defining the pay of admirals, vice-admirals, captains, and seamen. He also established royal dockyards at Deptford, Woolwich, and Portsmouth; and for the government of the whole service, instituted an Admiralty and Navy Board, the latter being the forerunner of the present Trinity Board. When this king died, he left 50 ships of various sizes, manned by about 8000 hands.

Under Edward VI., the navy fell off, but was sufficiently important in the succeeding reign for the English admiral to exact the salute to his flag from Philip II. with a larger Spanish fleet, when the latter was on his way to espouse Queen Mary. Elizabeth had the struggle with the Spanish Armada to try her navy, and left 42 ships, of 17,000 tons in all, and 8346 men—15 of her ships being upwards of 600 tons. From this period the tonnage of the ships steadily increased. Under James I. and Charles I., Mr Phineas Pett, M.A., the first scientific naval architect, remodelled the navy, abolishing the lofty forecastles and poops, which had made earlier ships resemble Chinese junks. In 1610, he laid down the *Prince-Royal*, a two-decker, carrying 64 large guns; and in 1637, from Woolwich, he launched the celebrated *Sovereign of the Seas*, the first three-decker, and certainly the largest ship hitherto constructed on modern principles. She was 232 feet in length, of 1637 tons, and carried at first 130 pieces of cannon; but being found unwieldy, was cut down, and then proved an excellent ship. She was burned in 1696.

Prince Rupert's devotion to the crown was bad for the navy, for he carried off 25 large ships; and Cromwell, on acceding to power, had but 14 two-deckers. His energy, however, soon wrought a change, and in five years he had 150 ships, of which a third were of the line; his crews amounted to 20,000 men. During the Protectorate, Peter Pett, son of Phineas, built the *Constant Warwick*, the earliest British frigate, from a French design and pattern. Cromwell first laid navy estimates before parliament, and obtained £400,000 a year for the service. The Duke of York, afterwards James II., assisted by the indefatigable Mr Samuel Pepys, did much for the navy, establishing the system of Admiralty government much on its present footing. In his time, Sir Anthony Deane improved the model of ships of war, again after a French design. James left, in 1688, 108 ships of the line, and 65 other vessels; the total tonnage of the navy, 101,892 tons; the armament, 6930 guns; and the personnel, 42,000 men. William III. sedulously augmented the force, foreseeing its importance to his adopted country. When he died, there were 272 ships of 159,020 tons, and the annual charge for the navy had risen to £1,056,915. George II. paid much attention to his fleets, and greatly augmented the size of the ships; he left, in 1760, 412 ships of 321,104 tons. By 1782, the navy had risen to 617 sail of 500,000 tons; and by 1802, to 700 sail, of which 148 were of the line. In 1813, there were 1000 ships (256 of the line), measuring about 900,000 tons, and carrying 146,000 seamen and

The Great Harry.

George III., in person, with the Black Prince, at the battle of Sluys, in 1340, defeated a greatly superior French fleet, with 40,000 men on board. Henry V.

## NAVY—NAZARETH.

marines, at an annual charge of about £18,000,000. Since the peace in 1815, the number of vessels has been greatly diminished, although their power has vastly increased.

The progressive augmentation of size in vessels may be judged from the increase in first-rates. In 1677, the largest vessel was from 1500 to 1600 tons; by 1720, 1800 had been reached; by 1745, 2000 tons; 1780, 2200 tons; 1795, 2350 tons; 1800, 2500 tons; 1808, 2616 tons; 1853, 4000 tons. From 1841, a gradual substitution of steam for sailing vessels began, which was not completed, however,

The Warrior Iron-clad Screw Steam War-ship.

till 1859. Since 1860, another reconstruction has taken effect, armour-plated frigates, impervious to ordinary shot, armed either as broadside vessels or in turrets, being substituted for timber vessels. At the same time three and two deckers have ceased to be employed, enormous frigates replacing them of a tonnage far exceeding the largest three-deckers of former times; they mount fewer guns, but those they carry are of stupendous calibre, and of rifled bore. The *Northumberland*, one of the largest frigates of this new class, is of 6621 tons, 1350 horsepower, and 38 large guns, while the *Devastation* (supposed, in 1874, to be the most powerful war-ship in the world) carries 4 great guns in turrets of the most massive armour.

On the 1st of April 1874, the effective vessels of

The Devastation.

the navy were as follows: 33 armour-plated frigates (3 building); 14 turret vessels (2 building); 3 armour-plated corvettes, and 2 sloops; 3 floating-batteries;

3 armoured gunboats; 37 ships of the line (without steam); 43 frigates (7 without steam); 17 transports, 6 yachts, and 5 schooners, total of 424 vessels. In 1874, 134 vessels were in the harbour or at home; 5 vessels in the coast-guard. The personnel amounts, for 1874, to 60,000 men, in the personnel, but excluding artificers and dockyards; the armament being almost entirely of heavy calibre. The annual year 1874—1875 is estimated at £10,000,000, may be thus broadly subdivided:

Wages, Victuals, and Clothing of Officers and Crew, . . . . .  
Admiralty Office, . . . . .  
Coast-guard and Naval Reserve, . . . . .  
Scientific Branch (Surveying, Hydrography, &c.), . . . . .  
Dockyards and Victualling Yards, . . . . .  
Stores for Building and Repairing Ships, . . . . .  
Miscellaneous Services, . . . . .  
Half-pay and Pensions, . . . . .  
Conveyance of Troops, . . . . .

Information on the various points connected with the navy, will be found in the respective heads, as ADMIRAL, CAPTAIN, SHIP-BUILDING, SIGNALS, &c.

**NAXOS**, the largest, most beautiful island of the Cyclades, is situated midway between the coasts of Greece and Minor Asia. Extreme length, about 20 miles. Pop. about 12,000. The island is traversed by a ridge which rises to the highest summit, 3000 feet. The plains and valleys are the principal products and articles of commerce, wine, corn, oil, cotton, fruits, and emeralds. (the best variety of which is still produced on the island, *Bacchus-wine*) ancient as it is in modern times, and the island was celebrated in the legends and especially in those relating to Ariadne. Its antiquities are a curious Hellenic unfinished colossal figure, 34 feet long, in an ancient marble quarry in the island, and always called by the name of Apollo. It was ravaged by the Persians and after the conquest of Constantinople, became the seat of a dukedom, of the Venetians. It now forms a portion of Greece (q. v.). Naxos, the capital, with a population of about 5000, is situated on the north coast, contains 16 Greek, and 4 Catholic churches, and is the seat of a Greek bishop. Its citadel was built by the Venetians.

**NAZARENE** (Gr. *Nazarenos* and *Nazareth*) was used as one of the designations of our Lord, and became a common appellation for Christians in Judæa. Although, or at least as a local appellation, there can be no doubt that Nazareth was but a second-rate town in the despised province of Galilee, it was applied to our Lord and his followers with contempt (John xviii. 5, 7; Acts xxiv. 7).

**NAZARETH**, a small town or village, anciently in the district of Galilee, territory of the tribe of Zebulun, 21 miles east of Acre. It lies in a hilly tract and is built partly on the sides of ridges, partly in some of the ravines between the ridges. It is celebrated as the place of the Annunciation, and the place where

## NAZARITES—NEANDER.

at the greater part of his life in obscure obscurity. Pop., according to Dr Robinson, 3120, of whom 1040 are Greeks, 520 Greek Catholics, 450 Maronites, and 680 Mohammedans. Porter makes 4000 a moderate estimate. In the earliest days of Christianity, N. was quite overlooked by the church. It did not contain a single Christian until before the time of Constantine, and the Christian pilgrimage to it took place in the 5th century. The principal building is the Latin church, reared, according to pious tradition, on the spot where the angel announced to the Virgin the birth of her Saviour-son; but the Greeks have erected, in another part of N., a church on the site of the Annunciation. Besides these rival churches, the traveller is shewn a Latin chapel, supposed to be built over the 'workshop of Joseph'; the chapel of 'the Table of Christ' (*Mensa Christi*), a vaulted chamber, containing the veritable table at which our Lord and his disciples used to sit; the synagogue, out of which he was thrust by the townsmen; and 'the Mount of Precipitation,' on which he narrowly escaped being cast headlong. The women of the village have been long famous for their beauty.

**NAZARITES** (from Heb. *nazar*, to separate) designated among the Jews those persons, male or female, who had consecrated themselves to God by certain acts of abstinence, which marked them off, 'separated' them, from the rest of the community. In particular, they were prohibited from drinking wine or strong drink of any kind, grapes, either moist or dry, or from shaving their heads. The law in regard to N. is laid down in the Book of Numbers (vi. 1-21). The only examples of the law recorded in Scripture are Samson, Samuel, and the Baptist, who were devoted from birth to this condition, though the law appears to contemplate temporary and voluntary, rather than perpetual Nazariteship.

**NEAGH, LOUGH**, the largest lake of the British Islands, is situated in the province of Ulster, Ireland, and is surrounded by the counties of Armagh, Londonderry, Antrim, and Down. It is 18 miles (English) in length, and 11 miles in breadth, contains 98,255 acres, is 120 feet in greatest depth, and is 48 feet above sea-level at low water. It receives the waters of numerous streams, of which the principal are the Upper Bann, the Blackwater, Moyola, and the Main; and its surplus waters are carried off northward to the North Channel of the Lower Bann. Communication by means of a canal subsists between the Lough and Belfast Lough, and the Tyrone coal-field. In some portions of the Lough, the waters shew remarkable purifying qualities, and petrified wood found in its waters is manufactured into hones. The southern shores of the Lough are low and marshy, and very fertile in appearance. It is well stocked with fish, and its shores are frequented by the swan, heron, teal, and other water-fowl.

**NEAL, DANIEL**, a dissenting minister and author, born in London, December 14, 1678. He was educated first at Merchant Taylors' School, and afterwards at Utrecht and Leyden, in Holland, and in 1706 succeeded Dr Singleton as pastor of a congregation in his native city. N.'s first work was a *History of New England* (1720), which met with a very favourable reception in America. Ten years afterwards, he published a tract, entitled *Narrative of the Method and Success of Inoculating Small-pox in New England by Mr Benjamin Franklin*, which excited considerable attention; but his production on which his reputation rests is his *History of the Puritans* (4 vols. 1732-1738), a work

of great labour, and invaluable as a collection of facts and characteristics both to churchmen and dissenters, though, of course, written in the interest of the latter. It involved its author in several controversies, which failing health rendered it impossible for him to prosecute. N. died at Bath, April 4, 1743.

**NEAL, JOHN**, an American author and poet, of Scottish descent, was born at Falmouth, now Portland, Maine, August 25, 1793. His parents belonged to the Society of Friends, of which he was a member until disowned, at the age of 25, because he failed to live up to the rule of 'living peaceably with all men.' With the scanty education of a New-England common school, he became a shop-boy at the age of 12; but learned and then taught penmanship and drawing. At the age of 21, he entered a haberdashery trade, first in Boston, and then in New York; and a year after, became a wholesale jobber in this business at Baltimore, in partnership with another American literary and pulpit celebrity, John Pierpont. They failed in 1816, and N. turned his attention to the study of law. With the energy which acquired for him the sobriquet of 'Jehu O'Cataraht,' affixed to his poem, *The Battle of Niagara*, he went through the usual seven years' law-course in one, besides studying several languages, and writing for a subsistence. In 1817, he published *Keep Cool*, a novel; the next year, a volume of poems; in 1819, *Otho*, a five-act tragedy; and in 1823, four novels—*Seventy-six*, *Logan*, *Randolph*, and *Errata*. These impetuous works were each written in from twenty-seven to thirty-nine days. In 1824, he came to England, where he became a contributor to *Blackwood's* and other magazines and reviews, and enjoyed the friendship and hospitality of Jeremy Bentham. On his return to America, he settled in his native town, practised law, wrote, edited newspapers, gave lectures, and occupied his leisure hours in teaching boxing, fencing, and gymnastics. Among his numerous works are *Brother Jonathan*, *Rachel Dyer*, *Bentham's Morals and Legislation*, *Authorship*, *Down-easters*, &c. After a long silence, devoted to professional business, he published, in 1854, *One Word More*; and in 1859, *True Womanhood*. The latter work, though a novel, embodies the more serious religious convictions of his later years. In 1870, appeared his *Wandering Recollections of a Somewhat Busy Life*. N.'s voluminous writings, with all their glaring faults of haste and inexperience, are full of genius, fire, and nationality.

**NEANDER, JOHANN AUGUST WILHELM**, by far the greatest of ecclesiastical historians, was born at Göttingen, 16th January 1789, of Jewish parentage. His name prior to baptism was David Mendel. By the mother's side, he was related to the eminent philosopher and philanthropist Mendelssohn (q. v.). He received his early education at the Johanneum in Hamburg, and had for companions, Varnhagen von Ense, Chamisso the poet, Wilhelm Neumann, Noodt, and Sieveking. Already the abstract, lofty, and pure genius of N. was beginning to shew itself. Plato and Plutarch were his favourite classics as a boy; and he was profoundly stirred by Schleiermacher's famous *Discourses on Religion* (1799). Finally, in 1806, he publicly renounced Judaism, and was baptized, adopting, in allusion to the religious change which he had experienced, the name of N. (Gr. *neos*, new; *aner*, a man), and taking his Christian names from several of his friends. His sisters and brothers, and later his mother also, followed his example. He now proceeded to Halle, where he studied theology with wonderful ardour and success under Schleiermacher,

and concluded his academic course at his native town of Göttingen, where Planck was then in the zenith of his reputation as a church historian. In 1811, he took up his residence at Heidelberg University as a privat-docent; in 1812, he was appointed there extraordinary professor of theology; and in the following year, was called to the newly established university of Berlin as Professor of Church History. Here he laboured till his death, July 14, 1850. N. enjoyed immense celebrity as a lecturer. Students flocked to him not only from all parts of Germany, but from the most distant Protestant countries. Many Roman Catholics, even, were among his auditors, and it is said that there is hardly a great preacher in Germany who is not more or less penetrated with his ideas. His character, religiously considered, is of so noble a Christian type that it calls for special notice. Ardently and profoundly devotional, sympathetic, glad-hearted, profusely benevolent, and without a shadow of selfishness resting on his soul, he inspired universal reverence, and was himself, by the mild and attractive sanctity of his life, a more powerful argument on behalf of Christianity than even his writings themselves. Perhaps no professor was ever so much loved by his students as Neander. He used to give the poorer ones tickets to his lectures, and to supply them with clothes and money. The greater portion of what he made by his books, he bestowed upon missionary, Bible, and other societies, and upon hospitals. As a Christian scholar and thinker, he ranks among the first names in modern times, and is believed to have contributed more than any other single individual to the overthrow, on the one side, of that anti-historical Rationalism, and on the other of that dead Lutheran formalism, from both of which the religious life of Germany had so long suffered. To the delineation of the development of historical Christianity, he brings one of the broadest, one of the most sagacious (in regard to religious matters), one of the most impartial yet generous and sympathetic intellects. His conception of church history as the record and portraiture of all forms of Christian thought and life, and the skill with which, by means of his sympathy with all of these, and his extraordinary erudition, he elicits, in his *Kirchengeschichte*, the varied phenomena of a strictly Christian nature, have placed him far above any of his predecessors. N.'s works, in the order of time, are: *Ueber den Kaiser Julianus und sein Zeitalter* (Leip. 1812); *Der Heil. Bernhard und sein Zeitalter* (Berl. 1813); *Genetische Entwicklung der vornehmsten Gnostischen Systeme* (Berl. 1818); *Der Heil. Chrysostomus und die Kirche, besonders des Orients, in dessen Zeitalter* (2 vols. Berl. 1821—1822; 3d ed. 1849); *Denkwürdigkeiten aus der Geschichte des Christenthums und des Christlichen Lebens* (3 vols. Berl. 1822; 3d ed. 1845—1846); *Antignosticus, Geist des Tertullianus und Einleitung in dessen Schriften* (Berl. 1826); *Allgemeine Geschichte der Christlichen Religion und Kirche* (6 vols. Hamb. 1825—1852); *Geschichte der Pflanzung und Leitung der Kirche durch die Apostel* (2 vols. Hamb. 1832—1833; 4th ed. 1847); *Das Leben Jesu Christi in seinem geschichtlichen Zusammenhange*, written as a reply to Strauss's work (Hamb. 1837; 5th ed. 1853); *Wissenschaftlichen Abhandlungen*, published by Jacobi (Berl. 1851); *Geschichte der Christlichen Dogmen*, also published by Jacobi (1856). The majority of these works, including the most important, have been translated into English, and form more than a dozen volumes of Bohn's 'Standard Library.'

NEAP-TIDES. See TIDES.

NEA'RCHUS, the commander of the fleet of Alexander the Great in his Indian expedition,

327—326 B. C., was the son of one who was born in Crete, but settled in 329 B. C., he joined Alexander in the body of Greek mercenaries, and ordered a fleet to be built on the coast, and received the command of it. He sailed from the mouth of the Indus to the Persian Gulf, in spite of great obstacles, resulting from bad weather and partly from the mutiny of his crews. N. left the Indus in September 325, and arrived at Susa in February 324, shortly after Alexander had marched overland. Fragments of his narrative of his voyage have been preserved in the *Indica* of Arrian.—See Dr Vincent's *Navigation of the Ancients in the Indian Ocean* (pp. 68—77, Lond. 1807), and C. Magni *Historiarum Scriptores* (pp. 100—101).

NEATH, a parliamentary and river-port of the county of Glamorgan, Wales, on a navigable river of the same name, about 10 miles north-east of Swansea. It is the site of the Roman station *Nidum*, and the remains of an ancient castle, burned in 1093, are in the immediate vicinity are the imposing ruins of the Abbey, described by Leland as 'the finest in all Wales,' but now sadly decayed by the smoke and coal-dust of the iron works of the district. There are at N. extensive copper and tin works. Copper, lead, tin plates, and fine bricks are extensively quarried, and coal and iron are mined. The trade of the port has largely increased in late years. Pop. (1871) 10,060.

NEB-NEB, or NIB-NIB, the name of a species of *Acacia Nilotica*, one of the species which yield gum-arabic, and a species of *Acacia*. These pods are much used in Egypt, and have been imported into Britain.

NEBRASKA, one of the United States, lying in lat. 40°—43° N., 104° W.; bounded on the W. by Vt., on the N. by Dakota, being partly separated by the Missouri River, and its branches, E. by Iowa and Missouri, from which it is separated by the Missouri River; S. by the Colorado. This state is about 350 miles east to west, and from 138 to 200 miles south, and has an area estimated at 77,000 square miles. Originally, when this state was a part of the Missouri Territory, it extended from the Missouri River to the Rocky Mountains, and from lat. 40° to the Canadian boundary. It was, at the time, British America. The city of Omaha, the starting-point of the Pacific Railway, Nebraska City, and Lincoln, the capital. N. is a vast plain rising gradually from the Rocky Mountains, with immense prairies of vast herds of buffalo, and with timbered river-bottoms. The chief cities are Omaha on its eastern, and the Northern Platte on its northern boundary, the Platte River, the Republican Fork of the Kansas River, and the Platte Valley, run through the whole centre of the territory, is bounded by the Rocky Mountains. There are quarries of sandstone, which hardens on exposure, and the soil is fertile. In the mountainous western region, gold, silver, copper, and cinnabar are found. The fertile lands of the eastern and central parts of the state are a great desert, 100 miles, 300 feet deep, full of bones and rich in fossil remains. The climate is healthy, and an abundance of days. The country produces wheat, corn, and tobacco, and fruits in abundance, and

prairies afford unequalled pasturage. The Omahas, Pawnees, Otoes, Sioux, and other wild tribes hunt over the unoccupied territories, but the immigration is progressing rapidly. Erected as a territory in 1854, it had, in 1860, a population, exclusive of Indians, of 28,836; and in 1870, with the same exclusion, it was 122,117. N. became a state in 1867.

NEBRASKA, or PLATTE, a river of Nebraska, one of the United States of America, rises in the Rocky Mountains, lat.  $42^{\circ} 30'$  N., long.  $109^{\circ}$  W., and flowing easterly 600 miles through the entire territory, watering its great valley, falls into the Missouri.

NEBUCHADNEZZAR. See BABYLON.

NEBULÆ, a name given to indistinct patches of light in the heavens, supposed to proceed from aggregations of rarely distributed matter belonging to distant worlds in the course of formation. By the gradual improvement of telescopes in power and distinctness, these nebulae have, one after another, become resolved into clusters of distinct stars, and it is now generally supposed that such a resolution of all nebulae which have been observed is only limited by the power of the telescope. It is probable that the group of stars with which our system is immediately surrounded, and which forms to our eyes the galaxy which studs the firmament, would, if looked upon from the immeasurable distances at which these so-called nebulae are situated, itself assume the appearance of such a nebula; and that in the intervals there exist spaces as void of starry worlds as these are comparatively full of them. See STARS. Some nebulae are of a round form, presenting a gradual condensation towards the centre; others consist of one star surrounded by a nebulous haze; while a third class present just the same appearance as would be exhibited by the solar system, if seen from a point immensely distant. These and other phenomena suggested to Laplace the idea, afterwards developed into a theory, and known as the *nebular hypothesis*, that these nebulae were systems in process of formation; the first stage presenting an agglomeration of nebulous matter of uniform density, which, in the second stage, shewed a tendency to gradual condensation towards the centre; and, finally, the nebulous matter round the now-formed centre of the system, separated itself into distinct portions, each portion becoming condensed into a planet. The same opinion regarding the formation of planets from nebulae was put forward by Sir William Herschel in 1811; but the subsequent discoveries made by Lord Rosse were supposed to expose a fallacy in this theory. That wonderful instrument, the spectroscopic, has, however, recently reinstated the nebular theory, by shewing that among these appearances there are real nebulae devoid of solid or liquid matter, and consisting of masses of glowing gas—apparently nitrogen and hydrogen.

NEBULY, one of the partition lines in Heraldry, which runs out and in, in a form supposed to represent the uneven edges of clouds.

NECESSITY. This word occurs in connection with two different philosophical subjects, namely, the freedom of the will (see FREE-WILL), and the nature of our belief in fundamental truths, such as the axioms of mathematics. It is alleged by some philosophers, that the truths held by us as most certain are the result of experience, and that the degree of certainty is but a measure of the universality of the experience. Others contend that such first principles as the axioms of mathematics are not only true, but necessarily true. Such necessity,

it is argued, cannot come from mere experience, and therefore implies an innate or intuitive source. Hence the theory of necessary truth is only another name for the theory of instinctive or intuitive truth.

Necessity is a word too vague in its signification to serve as a leading term in philosophy. There are several meanings attaching to it, which should be clearly set forth before entering on the discussion of such questions as those above mentioned.

1. Necessity, in the first place, means that one fact or statement is *implied* in another. Thus, if we say that all the apostles were Jews, it follows necessarily that Peter was a Jew; this is not a new fact, but merely a re-assertion of a portion of the same fact. We are not at liberty to affirm a thing in one form, and then deny the same thing when expressed in a different form. If we say this room is hot, it is repeating the assertion in another way, to say that it is not cold. These truths follow by necessary inference. Hence the general axiom of the syllogism, that what is true of a whole class must be true of each individual, is a necessary truth in this sense. In affirming such a truth, we merely declare that we shall be consistent, and that when we have affirmed a proposition in company with other propositions, we are prepared to affirm it when taken apart from the others. This kind of necessity is sometimes called Logical necessity, and sometimes Mathematical necessity. We might call it Deductive necessity, or necessity by Implication.

2. A second meaning is Inductive certainty; or the certainty that arises from a well-grounded experience. That lead will sink in water; that animals need food and air in order to live; that warmth promotes vegetation; are truths that we call necessary, in the sense of being so certain that we may always count upon them. We presume with the highest confidence, that an unsupported body will fall to the ground, not because the fact of falling is implied in the fact of matter, but because nature has uniformly conjoined the two facts. We can speak even of moral necessity; by which we mean only uniform sequence and consequent certainty. When we declare that children, whose education has been neglected, must fall into evil courses, we declare what experience has shewn us will happen in relation to the human mind.

3. When necessity means neither deductive implication, nor inductive certainty, it refers us to a peculiar test supposed to apply to the truths in dispute—namely, the inconceivableness of their opposite. It is said that, not only can we not believe in the opposite of the axiom, that 'the sums of equals are equal,' but we cannot even conceive, imagine, or picture to ourselves the opposite of it. This impossibility of conceiving the contradiction of any statement, is regarded by many as a peculiarly cogent circumstance in its favour. It distinguishes the axiomatic first principles from the truths of inductive science, these having, it is said, an inferior order of certainty. To this it may be replied, however, that men's power of conceiving is so much affected by their education and habits, that many things, whose opposites were at one time inconceivable, have since been found to be false. For example, the notion that men could live at the antipodes was once reckoned inconceivable, and we now know it to be a fact. An unvarying association will often produce a disability to conceive anything different.

In commencing a discussion as to the necessary character of any truth, the disputants should agree beforehand which of the three meanings they intend. In the controversy on the Mathematical axioms, maintained between Dr Whewell on the one hand, and Sir John Herschel and Mr J. S. Mill on the

other, the third meaning is more particularly involved. The doctrine of Inconceivability, as the test of truth, has been put forward by Mr Herbert Spencer, under the title of the Universal Postulate (*Principles of Psychology*, Part I.).

NE'CHÉS, a river of Texas, U. S., rises in the central eastern portion of the state, and flows south by east, 200 miles, into Sabine Bay, where its waters, with those of the Sabine River, find their way, by Sabine Pass, into the Gulf of Mexico.

NE'CKAR, one of the largest tributaries of the Rhine, and the principal river of Württemberg, rises near to the source of the Danube, on the eastern declivity of the Black Forest, and close to the village of Schweningen. It has a winding course of 240 miles, first north-east to its junction with the Fils, then north to its junction with the Jaxt, and finally north-west to Mannheim, where it joins the Rhine. The principal places on its banks are Tübingen, Heilbronn, Heidelberg, and Mannheim. Its course, leading first through a deep and narrow dale, leads afterwards through a succession of wide and fertile tracts, enclosed by soft vine-clad hills. The scenery of its banks is, in general, very beautiful, and in many places highly romantic. From Cannstadt, about midway in its course, the N. is navigable; steamers ply regularly to Heidelberg. Good wines are grown on its banks. Chief affluents, on the left, the Enz; on the right, the Fils, Rems, the Kocher, and the Jaxt.

NECKER, JACQUES, a famous financier and minister of France, was born, 30th September 1732, at Geneva, where his father, a native of Brandenburg, but of Anglo-Irish descent, was professor of German law. He became a banker in Paris, and acquired a large fortune during the Seven Years' War. After retiring from business, he became the representative of his native city at the French court; and also acquired a high but not exactly a solid reputation by his publications on political economy and finance, particularly his *Essai sur la Législation et le Commerce de Grains* (Par. 1775). In this essay he appears as the opponent of the wise Turgot's liberal measures in regard to the traffic in grain, and claims for the state the right of fixing its price, and if it thinks it necessary, of prohibiting its exportation. On the removal of Turgot from office in June 1776, N. was called to assist in financial affairs, and after the brief administration of Clugny, he was made General Director of Finances in June 1777. N. could not conceal his elation. This was his weak point. He had all the vanity, egotism, and love of show that marked his brilliant but superficial daughter. Nevertheless, he succeeded not only in meeting the exigencies of the American war, but in restoring to some degree of order the general financial affairs of the country, though mainly by the perilous expedient of borrowing, which he was enabled to do to an almost unlimited extent, owing to the confidence reposed in his financial dexterity. Some years he borrowed as much as 490 millions of francs. His Protestantism, however, and some retrenchments which he made in the royal household, with his publication on the financial affairs of France (*Compte Rendu*, which produced an immense sensation), made him an object of great dislike to the queen and court, and on 12th May 1781 he was suddenly dismissed. He retired to Geneva, where he was visited, from motives of sympathy and respect, by the highest personages in the realm, the Prince of Condé, the Dukes of Orleans and Chartres, the Prince of Beauvau, the Duke of Luxembourg, Maréchal de Richelieu, the Archbishop of Paris, &c. but returned to Paris in 1787, from which he was soon

banished on account of an attack published on the financial management and ignorant Calonne. In the financial crisis, however, which followed the administration of Loménie de Brienne, he found himself under the necessity of returning. In November 1788 to the office of Controller-General of Finances and Minister of Commerce, he recommended the calling of the States-General, thereby acquired the greatest popularity, but failed, however, in the difficult task of having no capacity for political action, and their mere financial aspects. On 23d June 1789, determined upon the resolution of the third estate, N. was king therefore dismissed him or required him to leave the office immediately. He obeyed, but the 12th, 13th, and 14th of July (on the 14th the Bastille was taken) was his dismissal, and the king was unable of recalling him. He now allied himself with Mounier and other ministers for of a constitution like that of the chambers or Houses of Parliament, a great diminution of his popularity, unable to contend in debate with other great leaders of the Nation, the rejection by the assembly of a loan, and the adoption instead of a scheme of assignats, he resigned in September 1790, and retired to his native near Geneva, where he died, 17th April 1796. Besides the works already mentioned several on political and on religiously, particularly a work on the French Revolution (Par. 1796), which has been frequently reprinted. His daughter was the celebrated Madame de Staël.

NECK-MOULDING. A junction of the capital and shaft of a column, the plain space between the astragal and the mouldings of the cap of the column is called the neck.

NE'CROMANCY (Gr. *nekros*, dead; *man*, divination), a mode of divination by consulting the dead to question them about the future. It originated in the east, and is the most remote antiquity. It is mentioned in the Old Testament; and the story of the conjuration of Endor affords a remarkable illustration. The eleventh book of Homer's *Odyssey* is entitled *Nekromanteia*, and in it the practice is represented as brought up by Ulysses. In most parts of Greece it was practised by priests or conjurers in the temples; in Thessaly, it was practised by a distinct class of persons called 'Evokers of Spirits'. The practice of necromancy was ultimately connected with the most horrid rites, in which human beings were portions of bodies from funeral pyres cut out of the womb, &c., were sometimes human beings were sometimes spirits might be consulted ere they entered into the lower world. The establishment of Christianity under Constantine caused the practice to be placed under the ban of the church, and the evident traces of necromancy in the Norse and Teutonic poems. The practice of the evocation of spirits belongs to the most ancient times. See *Peuce de Præcipuis Divinationum Generibus*.

NECRO'PHILISM, an unnatural love or appetite for the dead which

self in various ways. Consorting or living with the dead has been observed as a characteristic of melancholia. Individuals have inhabited graveyards, preferring the proximity and association of corpses with which they had no tie, to the cheerfulness and comforts of home; and there is recorded the notorious case, in which a gentleman, although on bad terms with his wife while alive, carried her body with him through India, scandalising the natives, and outraging the feelings of all, by placing the coffin under his bed. This hideous tendency may enter into certain developments of cannibalism, where the feast is celebrated in memory of a departed friend, rather than in triumph over a slain foe. It is affirmed that there were anthropophagous epidemics in 1436 and 1500; and the history of vampirism connects that delusion with the moral perversion now described. Patients in asylums, especially in continental asylums, are often encountered who bemoan the crime of having devoured the dead, and violated charnel-houses. The most extraordinary exhibition of necrophilism is where individuals, not in fancy but in reality, have exhumed corpses, to see them, to kiss them, to carry them away to their own homes, or to mutilate and tear them to pieces. It is worthy of notice that, so far as such cases have been observed in this country, they have been confined to communities living in remote places, of rude and unenlightened character, and cherishing the superstitions of ages and states of society with which they have no other connection, and of which they have almost lost the recollection.—*Annales Médico-Psychologiques*, t. viii. p. 472.

**NECROPOLIS**, a Greek term, meaning the city of the dead, and applied to the cemeteries in the vicinity of ancient cities. It occurs in classical antiquity only as applied to a suburb of Alexandria, lying to the west of that city, having many shops and gardens and places suitable for the reception of the dead. The corpses were received and embalmed there. Here Cleopatra, the last of the Ptolemies, applied the asp to her breast, to avoid the ignominy of being led in triumph by Augustus. The site of the necropolis of ancient Alexandria seems to have been where are now the catacombs, consisting of galleries and tombs hollowed out of the soft calcareous stone of which the city is built, and lying at the extremity of the city. The modern necropolis is now, however, used in a much more extended sense, and applied to all the cemeteries of the ancient world. These consisted either of tombs, constructed in the shape of houses and temples, and ranged in streets, like a city of the dead; or else chambers hollowed in the rock, and ornamented with façades, to imitate houses and temples. Such cemeteries are to be distinguished from the columbaria, or subterranean chambers of the Romans, in which their urns were deposited; or the rows of tombs along the Via Appia; or the cemeteries of the Christians, whose bodies were deposited in the ground. The most remarkable necropolises are that of Thebes in Egypt, situated at a place called *Wah*, on the left bank of the Nile, capable of holding 3000 persons, and which it is calculated must at least have contained 5000 mummies; those of El-Kab or Eleithyia; of Beni-Hassan, or the *Neos Artemidos*; and of Madfun or Abydos; of *Wah* or the Oasis of Ammon. See **OASIS**. In Africa, the necropolis of Cyrene is also extensive; and those of Vulci, Corneto, Tarquinii, and Capua are distinguished for their painted tombs (see **URN**), and the numerous vases and other objects of ancient art which have been exhumed from them. Large necropolises have also been found in Lycia, Sicily, and elsewhere.

Strabo, xviii. p. 795—799; Plutarch, vit Anton; Letronne, *Journal des Savans*, 1828, p. 103; Dennis, *Cities and Cemeteries of Etruria*, i. 412, i. 276—358.

**NECROSIS** (Gr. *nēkros*, dead) is a term employed to denote the death or mortification of bone, but often restricted to the cases in which the shaft of a long bone dies, either directly from injury or from violent inflammation, and is enclosed by a layer of new bone; the death of a thin superficial layer, which is not enclosed in a shell of new bone, being usually termed *exfoliation*.

The bones of the lower extremity—the femur and tibia—are those which are most frequently affected by necrosis. The lower jaw is, however, extremely often affected by it, in persons engaged in making lucifer-matches; the disease being set up by the pernicious action of the vapour of phosphorus. The dead bone, known as the *sequestrum*, generally consists of the circumference of the shaft only, and not of the interior, and the inside of the dead portion presents a rough appearance, as if worm-eaten. If the membrane investing the bone (the periosteum) remain healthy, it deposits lymph, which speedily ossifies, forming a shell of healthy bone, which completely invests the dead portion.

The essential point in the treatment is the removal of the *sequestrum*, which is too purely a surgical operation to be described in these pages.

**NECTAR**, the name given by Homer, Hesiod, Pindar, and the Greek poets generally, and by the Romans, to the beverage of the gods, their food being called *Ambrosia* (q. v.). But Sappho and Aleman make nectar the food of the gods, and ambrosia their drink. Homer describes nectar as resembling red wine, and represents its continued use as causing immortality. By the later poets, nectar and ambrosia are represented as of most delicious odour; and sprinkling with nectar, or anointing with ambrosia, is spoken of as conferring perpetual youth, and they are assumed as the symbols of everything most delightful to the taste.

**NECTARINE**. See **PEACH**.

**NECTARY**, in Botany, an organ in the flowers of many phanerogamous plants, devoted either to the secretion or the reception of honey. Of the former kind are nectariferous glands, scales, and pores; of the latter, tubes, cavities, &c. But the term was for a long time very vaguely employed by botanists, and seemed to be found convenient for the designation of any part of a flower for which no other name was known. Thus amongst the parts called nectaries by the older botanists, may be found those now called *Disc* (q. v.), and that which bears the name of *Corona* (q. v.).

**NEEDFIRE** (Ger. *nothfeuer*; allied to Sw. *gnida*, to rub; Eng. *knead*), fire obtained by the friction of wood upon wood, or the friction of a rope on a stake of wood, to which a widespread superstition assigns peculiar virtues. With varieties of detail, the practice of raising needfire in cases of calamity, particularly of disease among cattle, has been found to exist among most nations of the Indo-European race. It has been supposed effectual to defeat the sorcery to which the disease is assigned. When the incantation is taking place, all the fires in the neighbourhood must be extinguished, and they have all to be relighted from the sacred spark. In various parts of the Scottish Highlands, the raising of needfire was practised not long ago, and it is perhaps still had recourse to in some very remote localities. The sacrifice of a heifer was thought necessary to insure its efficiency. The ways of obtaining fire from wood have been various; one is by an apparatus which has been called the 'fire-churn,' a cylinder turning on a pivot, and furnished

## NEEDLES.

with spokes, by means of which it is made to revolve very rapidly, and fire is generated by the friction. Fire struck from metal has been supposed not to possess the same virtue, and in some instances the persons who performed the ceremony were required to divest themselves of any metal which might be about them. In its origin, the fire-churn was considered a model of the apparatus by which the fires of heaven were daily rekindled. It is still in daily use in the temples of the Hindus. The same superstition was doubtless the origin of the story of Prometheus (q. v.). See Grimm's *Deutsche Mythologie*; Supplement to Jamieson's *Scottish Dictionary*.

NEEDLES are instruments of metal, or other material, for the purpose of carrying the thread in sewing, embroidery, knitting, netting, and other similar operations. They are generally made of metal, but bone, ivory, and wood are also used; for ordinary needle-work, called sewing, they are made of fine steel, and are too well known to need description; for other kinds of work, they are often much larger and differently formed, according to the requirements of the work to be done.

Needle-making is an important branch of industrial art, and it has of late years attained to extraordinary perfection. Small bars of steel, not thicker than a good-sized bristle, can be made perfectly round, pointed at one end with wonderful accuracy, pierced at the other end with an oval hole, the sides of which are so smoothly rounded that there is no friction upon the thread, and the whole of each instrument, not more than an inch in length, beautifully polished, and sold at less than a shilling per hundred, notwithstanding that a large part of the operations required in their manufacture are manual. The first operation, after the wire has been selected, and its thickness accurately gauged, is to cut it into eight-foot lengths; this is done by winding it in a coil of 16 feet circumference, and then cutting this coil into exact halves

Fig. 1.

with powerful cutting shears. The coiling of the wire is so managed, that there are 100 pieces in each half when cut; the bundles of 100 wires are again cut into the necessary lengths for two needles; and so well arranged are the cutting shears, that a man can easily cut enough for 1,000,000 needles in a day of 12 hours. The pieces cut from a coil, although now reduced to the length of two small needles, are nevertheless somewhat curved; they are therefore collected into bundles of about 6000, and placed in two iron rings, which hold them loosely together, as in fig. 1; they are then slightly softened

Fig. 2.

by firing, and are laid on an iron plate or bench, and are pressed with a small curved bar (fig. 2) in two or three positions, by which the operator manages to make them all perfectly straight. They are now taken to the grinder, who sits in front of his grindstone upon a seat which is hollow, and forms an air-shaft open towards the stone; through this a blast of air is forced when the wheel is in motion, which carries away from the grinder every particle of the subtle dust from the needle points and the stone. Before this humane invention, which has rendered the operation quite innocuous, the loss of life in this manufacture was more serious than in any other

industrial occupation. The operator, with his hands holds about 25 of the wires, by means of his fingers, the ends of which are pressed against the inside of his fingers, the wires which are held straight and applied to the stone, being dexterously turned round on the thumb of the hand by means of the thumb, until the point is ground sharp at one end; they are then rounded at the other ends are similarly sharpened. They are next taken to the *impressing machine*, which in principle consists of a weight falling on a block, which is raised by the hand, and falls at pleasure; the wires are placed in a row under this, so that the falling weight strikes the wire exactly in the middle, and there flattens it as in fig. 4. The hardening of the flattened

Figs. 3, 4, 5, 6.

the blow is removed in the annealing oven, and holes are next punched, two in each flattened portion, as in fig. 5. These are either done by hand-punches worked by children, who acquire great nicety in the operation, or by a machine on the same principle as the *impressing machine*; this only punches the two holes, but also forms a small cross-cut between them (as seen in fig. 5), which is otherwise made by a file. At this cross-cut the wire is broken in two, and may now be regarded as two rudely-formed needles (fig. 6), each having a flattened and pierced head, as shown in fig. 7. A number of these are now threaded (*spilled*) on a

Fig. 7.

Fig. 8.

wire, as in fig. 8, and are placed in a vice, which holds them firm and straight, so that the workman can file the heads on the top and sides, so as to round all the burred edge outside the dotted line in fig. 7. The next process is *oil tempering*, for which they are made hot, and immersed in sufficient oil to coat them thoroughly; the oil is then burned off, an operation which renders the needles brittle. They are then weighed out into lots of about 500,000 each, and after being shaken so that they lie side by side, they are laid on a square piece

Fig. 9.

of strong canvas, and a quantity of sand and emery powder being mixed with them, they are corded very securely into a long roll (fig. 9), from

## NEEM-TREE—NEGATIVE QUANTITIES.

aches to 2 feet in length. A number of these bolls or bundles are placed on a movable wooden slab, in the *scouring machine*, and over them is placed another heavily weighted slab. The action of the machine, of which these slabs form part, is to move them backwards and forwards in opposite directions, the bundles of needles acting as rollers, the pressure upon which works the enclosed needles, and, &c. together, so that after eight to ten hours, which this operation occupies, instead of the blackened appearance they had when it commenced, they are white and silvery-looking. They are now removed to an exactly similar machine, where they are polished. Here they are separated from the sand and emery, and are removed to other canvas squares; and when mixed up with a paste of *putty-powder* and oil, are again corded up, and made to roll backwards and forwards under the weighted wooden slab of the *polishing machine* for four hours more. The next process is to remove them from the canvas, and agitate them in a vessel with soft-soap and water, to remove the oil and putty-powder, and next to dry them in ash-wood saw-dust. They are now highly polished and well tempered, but not all of exactly the same length, nor are the eyes perfect; they are therefore passed to a person who, by nice arrangement of a small gauge, sorts them very nicely into certain lengths (*evening*), and arranges them all in one direction (*heading*). They then pass on to be drilled, an operation requiring great dexterity, as the small oval holes have to be so polished all round, as not to cause any friction on the thread in sewing with them; a clever workman will drill and polish the holes of 70,000 needles per week. The needle is now practically finished, but many minor operations are considered necessary to produce high-finish; these we purposely omit, to avoid complicating our description. It is, however, worthy of remark, that this little instrument, which costs so much labour for its formation, has by these operations acquired immense value. The wire of which the ordinary-sized needles are made is so fine, that 5½ pounds go to form 74,000 needles. Ordinarily sized needles, 2½ millions weigh 3 cwt., and are worth rather more than £200, although the steel wire of which they were made was only worth £4 at the commencement of the manufacture. English-made needles are the best in the world, and are chiefly made in Redditch and the neighbourhood, where, and in other parts of the county of Worcester, this manufacture employs a large number of persons.

**NEEM-TREE.** See MELIACEÆ.

**NEERWINDEN**, a small village of Belgium, in the north-west corner of the province of Liege, is celebrated in history for the great victory gained by the French under Luxembourg over the English under William III. (29th July 1693); and also for the defeat of the French under Dumouriez by the allies under the Prince of Coburg (18th March 1793).

**NE EXEAT REGNO** is the title of a writ issued by the Court of Chancery to prevent an individual leaving the kingdom, unless he gives security to abide a decree of that court. The writ was originally resorted to in cases of attempts against the safety of the state, but is now issued in cases where an equitable debt or demand is sought to be substantiated by a bill or proceeding in Chancery. The writ is only granted where the party usually resides within the jurisdiction. It resembles the process which is known in the common-law courts as arresting and holding to bail, and in Scotland as arresting a person *in meditatione fugæ*.

**NEGATIVE**, in Photography, is that kind of photographic picture in which the lights and shadows

of the natural object are transposed; the high lights being black, and the deep shadows transparent, or nearly so. Negatives are taken on glass and paper by various processes, and should indicate with extreme delicacy, and in reverse order, the various gradations of light and shade which occur in a landscape or portrait. A negative differs from a positive inasmuch as in the latter case it is required to produce a deposit of pure metallic silver to be viewed by *reflected* light; while in the latter, density to *transmitted* light is the chief desideratum; accordingly inorganic reducing and retarding agents are employed in the development of a positive, while those of organic origin are used in the production of a negative. Adopting the collodion process (which has almost completely replaced every other) as a type of the rest, the conditions best adapted for securing a good negative may be briefly indicated, leaving it to the reader to apply the principles involved to any process he may desire to practise.

The possession of a good lens and camera being taken for granted, and favourable conditions of well-directed light being secured, all that is necessary is to establish a proper and harmonious relation between the collodion bath, developer, and time of exposure. A recently-iodised collodion will generally be tolerably neutral, in which case, if the developer be at all strong, and the weather warm, the bath should be decidedly acid, or *fogging* will be the result. Should the collodion, however, be red with free iodine, a mere trace of acid in the bath will suffice, while the development may be much prolonged, even in warm weather, without fogging. If the simple fact be borne in mind that the presence of acid, either in the bath collodion or developer, retards the reducing action of the developer, it will suffice to guide the operator in many difficulties. The value of a negative consists in the power it gives of multiplying positive proofs. See POSITIVE PRINTING; also PHOTOGRAPHY.

**NEGATIVE QUANTITIES** are generally defined as quantities the opposite of 'positive' or 'numerical' quantities, and form the first and great point of difference between algebra as a separate science, and arithmetic. In the oldest treatises on algebra they are recognised as distinct modifications of quantity, and existing apart from, and independent of positive quantity. In later times, this opinion was vigorously combated by many mathematicians, among whom Vieta occupied a prominent place; but the more eminent analysts retained the old opinion. Newton and Euler distinctly assert the existence of negative quantities as quantities less than zero, and the latter supports his opinion by the well-known illustration of a man who has no property, and is £50 in debt, to whom £50 requires to be given in order that he may have nothing. After all, this discussion is little more than a verbal quibble, though interesting from the prominent position it for a long time held. It had its rise in the difficulty of satisfying the requirements of a constantly progressing science by the use of signs and forms retaining their original limited signification. It was soon felt that the limited interpretation must be given up; and accordingly an extension of signification was allowed to signs and modes of operation. + and -, which were formerly considered as merely symbols of the arithmetical operations of addition and subtraction, were now considered as 'general cumulative symbols, the reverse of each other,' and could signify gain and loss, upwards and downwards, right and left, same and opposite, to and from, &c. Applying this extended interpretation of signs to a quantity such as -4, we obtain at once a true idea of a negative quantity; for if +4 signifies 4 inches *above* a

ideas conveyed by algebraic expressions than by ordinary language: If at the present time a father is 50 years, and his son 20 years old, when will the father be three times as old as his son. This problem, when solved, gives -5 as the number of years which must elapse before the father's age is three times the son's. Now, at first sight, this result appears to be absurd, but when we consider the terms of the problem, its explanation is easy. The question asked pointed to a number of years *to come*, and had the result turned out to be *positive*, such would have been the case, and the fact of its being negative directs us to look in a 'contrary' direction, or backwards to time *past*; and this is found to satisfy the problem, as 5 years 'ago' the father was 45 and his son 15.

Negative quantities arise out of the use of general symbols in subtraction, as in the formula  $a - b$ , where we may afterwards find that  $b$  is greater than  $a$ . See SUBTRACTION.

**NEGRI'TOS**, or **NEGRI'LLOS** (*Spanish*, diminutive of Negroes), is the name given by the Spaniards to certain Negro-like tribes inhabiting the interior of some of the Philippine Islands, and differing essentially both in features and manners from the Malay inhabitants of the Eastern Archipelago. They bear a very strong resemblance to the Negroes of Guinea, but are much smaller in size, averaging in height not more than four feet eight inches, whence their appellation of N., or little Negroes. They are also called by the Spaniards *Negritos del Monte*, from their inhabiting the mountainous districts for the most part; and one of the islands where they are most numerous, bears the name of *Isla de los Negros*. These N. are also known by the names Acta, Aigta, Ite, Inapta, and Igolote or Igorote. They are described as a short, small, but well-made and active people, the lower part of the face projecting like that of the African Negroes, the hair either woolly or frizzled, and the complexion exceedingly dark, if not quite so black as that of the Negroes. The Spaniards describe them as less black and less ugly than the Negroes—*Menos Negros y menos feos*. All writers concur in speaking of them as sunk in the lowest depths of savagedom, wandering in the woods and mountains, without any fixed dwellings, and with only a strip

soul from heathenism. The hardly understood her own a very little Tagal, so that difficulty in understanding ea

According to Spanish states only in five of the Philippine Luzon, Mindoro, Panay, Neg and are estimated at about nants of them exist, however some of the other islands in pelago; and they are scattered small numbers, through certain They are altogether an island treated of by Prichard under Pelagian Negroes. ## NEGRO MINSTRELSY—NEGROES.

United States, and is now popular at public entertainments. The sentiment of the earlier of these negro melodies was of the most simple kind, the words mostly broken English, and the harmonies confined chiefly to two chords—the tonic and dominant. How the airs were composed has been a matter of curious inquiry. Some of them are believed to be broken down and otherwise altered old psalm-tunes, which had been caught up by the more musical of the negro race. In some instances, the singing of the melodies is accompanied with grotesque gestures; the effect being to give the idea of good-nature and love of fun in the dark-skinned minstrels. Negro melodies may be said to have been made known by Mr D. Rice, who first in New York, in 1831, and afterwards in London, created a sensation by his singing of *Jim Crow*. Other songs followed, such as *Jim along Josey*, and *Buffalo Gals*; and from less to more, there was created a very characteristically national music, if the Americans will allow us to call it so. Becoming extensively popular, and addressed to fashionable audiences, this negro minstrelsy now comprehends a large variety of songs, with airs of a pleasing kind, the whole much in advance of the original negro compositions. For these improvements, the world is indebted, among others, to Mr E. P. Christy, who began as conductor of a band of minstrels at Buffalo in 1842, and who established himself in New York in 1846. At first, his troupe were called the 'Virginia Minstrels,' but afterwards they were known as the 'Christy Minstrels.' Mr Christy's great success in this species of entertainment brought other leaders and troupes into the field. In most cases, the members of the negro minstrel troupes are only negroes in name, with faces and hands blackened for the purpose. See *Christy's Minstrels' New Songs, with Music*, edited by J. Wade. London, 1859.

NEGROES (from the Spanish word *negro*, black; Lat. *niger*) is the name given to a considerable branch of the human family, possessing certain physical characteristics, which distinguish it in a very marked degree from the other branches or varieties of mankind—more especially the so-called Whites or Europeans. In Blumenbach's fivefold division of mankind, the Negroes occupy the first place under the variety *Ethiopian*, which likewise embraces the Kafirs, Hottentots, Australians, Alforesans, and Oceanic Negroes. In Latham's threefold division, they are placed among the *Atlantides*, and form the primary subdivision of *Negro Atlantides*, that author's classification; while in Pickering's sevenfold division, they occupy the last place in his enumeration of the races of mankind.

Both Prichard and Latham strongly protest against the common error of looking upon the term Negro as synonymous with African. 'It ought to be remembered,' says the former, 'that the word Negro is not a national appellation, but denotes the ideal type constituted by the assemblage of certain physical characteristics, which is exemplified in the natives of Guinea in Western Africa, and in their descendants in America and the West Indies.' And Latham in like manner observes: 'No fact is more necessary to be remembered, than the difference between the Negro and African; a fact which is well verified by reference to the map. Here the true Negro area—the area occupied by men of the black skin, thick lip, depressed nose, and woolly hair—is exceedingly small; as small in proportion to the rest of the continent, as the area of the district of the stunted Hyperboreans is in Asia, or that of the Alps in Europe. Without going so far as to maintain that a dark complexion is the exception rather than the rule in Africa, it may safely be said that the

hue of the Arab, the Indian, and the Australian is the prevalent colour. To realise this we may ask, what are the true Negro districts? and what those other than Negro? To the former belong the valleys of the Senegal, the Gambia, the Niger, and the intermediate rivers of the coast, parts of Sudania, and parts about Sennaar, Kordofan, and Darfur; to the latter, the whole coast of the Mediterranean, the Desert, the whole of the Kafir and Hottentot areas south of the line, Abyssinia, and the Middle and Lower Nile. This leaves but little for the typical Negro.' Bearing in mind this limitation of the primitive area of the Negro, we shall next proceed to speak of his prominent physical characteristics.

The Negro has a black skin, unctuous and soft; woolly hair; thick lips; the lower part of the face prognathic, or projecting like a muzzle; the skull long and narrow; and a low, retreating forehead. The skull of the Negro is remarkably solid and thick, so that in fighting they often butt against each other like rams, without much damage to either combatant; and it is likewise so flat that burdens are easily carried upon it. According to Camper's lateral admeasurement, the head of the Negro shews an angle of 70°, while that of the European shews one of 80°, on which difference of 10°, as he considered, depends the superior beauty of the latter. There is not much dependence, however, to be placed on such a mode of admeasurement; and the same may be said of Blumenbach's vertical method. According to this, a considerable difference would appear to exist between the skull of the Negro and that of the European. 'But,' says Dr Prichard, 'I have carefully examined the situation of the foramen magnum in many Negro skulls; in all of them its position may be accurately described as being exactly behind the transverse line bisecting the antero-posterior diameter of the basis cranii. This is precisely the place which Owen has pointed out as the general position of the occipital hole in the human skull. In those Negro skulls which have the alveolar process very protuberant, the anterior half of the line above described is lengthened in a slight degree by this circumstance. If allowance is made for it, no difference is perceptible. The difference is in all instances extremely slight; and it is equally perceptible in heads belonging to other races of men, if we examine crania which have prominent upper jaws. If a line is let fall from the summit of the head at right angles with the plane of the basis, the occipital foramen will be found to be situated immediately behind it; and this is precisely the case in Negro and in European heads.' There is, in fact, neither in this respect—the conformation of the Negro skull—nor in any other, solid ground for the opinion hazarded by some writers, and supported either through ignorance or from interested motives by many persons—that the Negro forms a connecting link between the higher order of apes and the rest of mankind. The difference is certainly considerable between the highest European and the typical Negro, but the gulf between them both and the highest of the Simiæ is so nearly of the same width, that the difference is scarcely distinguishable. But the skin, hair, skull, lips, maxillary profile, and general facial appearance of the Negro, are not the only features that distinguish him in a great degree from the European, and seem to stamp him as a distinct variety of the human race. 'In the Negro,' says Prichard, 'the bones of the leg are bent outwards. Soemmering and Lawrence have observed that the tibia and fibula in the Negro are more convex in front than in Europeans; the calves of the legs are very high, so as to encroach upon the hams; the

depend upon the greater amount of pigment cells in the *rete Malpighii*, and in the greater number of cutaneous glands, as compared with the skin of Europeans. In the skin of the Negro there is much oily matter, and he perspires profusely, which serves to keep him in health, while it diffuses a smell far from agreeable to bystanders whose olfactory nerves are at all sensitive. Of the hair of the Negro, Dr Prichard remarks: 'I am convinced that the Negro has hair properly so-called, and not wool. One difference between the hair of a Negro and that of a European, consists in the more curled and frizzled condition of the former. This, however, is only a difference in the degree of crispation, some European hair being likewise very crisp. Another difference is the greater quantity of colouring matter or pigment in the hair of the Negro. It is very probable that this quality is connected with the former, and is its cause, though we cannot determine in what manner one depends upon another; but as these properties vary simultaneously, and are in proportion one to another, we may infer that they do not depend upon independent causes.'

The Negroes, in their native seat, comprise various independent tribes, which are thus classified and enumerated by Dr Latham: 1. *Western Negro Atlantida*, embracing the Woloffis, Sereres, Serawolli, Mandingos, Felups, &c.; Fantis, &c.; the Ghá, the Whidah, Maha and Benin tribes, the Grebo, &c. 2. *Central Negro Atlantida*, embracing the Yarriba, the Tapua, Haussa, Fulahs, Cumbri, Sungai, Kissúr, Bornú, &c.; Begharmi, Mandara, Mobba, Furians, Koldagi. 3. *Eastern Negro Atlantida*, embracing the Shillúk, &c.; Qámamyl, Dallas, &c.; Tibboo, Gongas. This list might, of course, be still further enlarged by reference to the works of Barth, Livingstone, Speke, and other travellers, whose researches have been published since the appearance of Dr Latham's *Varieties of Man*, in 1850.

While these several tribes have their distinctive peculiarities, they yet bear a strong general resemblance to each other, not only in their physical appearance, but in their intellectual capacities, moral instincts, customs, and manners. The Negro intellect is generally acknowledged to be inferior not only to the European, but to that of many primitive races not as yet brought within the pale of civilisation, while it is superior to that of the

lowest intelligent of the bosom of Africa.' All tribes be passionately fond of music and skill in the manufacture of. They also express their hopes in song. Where Mohammedanism has been introduced, the religion is nothing but a debased *fetish* of serpents, elephants and other parts of animals, at *fetish man*, or priest. They are of wood and stone, which they under all this, they have some being. They believe in good and as this generally leads to for the most part indifferent human life. In some parts human victims to propitiate the cruel to their enemies and prison blood for the mere savage del in seeing it flow from their vic allude to the inhuman customs, Dahomey, and the Yam and Ashantees, as described by Bo this statement.

This same indifference to human with the passion of avarice, has mainspring of the slave-trade many centuries between the Negro traders in the western coast of the Portuguese as early as 1500 were first imported into the West by Ferdinand of Aragon in 1502 by Charles V., legalised in England, and eventually practised nation of Europe, this infamous under the sanction of law as long when it was happily abolished in Great Britain, and is now almost every civilised nation. it is practised by lawless men, humane efforts of Great Britain United States to suppress it; ment which it has given to the

## NEGROPONT—NEILGHERRY HILLS.

of the neighbouring clans, and to sell them to strangers; many sell their own. Every recess, and almost every retired corner of the land, has been the scene of hateful rapine and slaughter, not to be excused or palliated by the spirit of warfare, but perpetrated in cold blood, and for the love of gain.

The custom of polygamy prevails among all the Negro tribes, and where these are constituted into nations or kingdoms, as in Dahomey, the sovereign has often as many as two or three thousand wives, whom he occasionally disposes of as presents to his chief officers and favourites.

The languages of the various nations and tribes of Negroes are very numerous. Vocabularies of nearly 200 languages have been brought from Africa by the Rev. Dr Koelle. 'A slight examination of these vocabularies,' says Mr Edwin Norris, 'seems to shew that there are among the Negro idioms a dozen or more classes of languages, differing from each other at least as much as the more remote Indo-Germanic languages do.' To these Negro idioms Dr Krapf has given the name of *Negro-Hamitic Languages*. These may perhaps have affinities with some of the other African tongues, but not with any of the great well-defined families of languages. For further information upon this subject, we must content ourselves with referring to Dr Prichard's *Natural History of Man*, and especially to a learned note by Mr Edwin Norris, in vol. i. of that work, page 323.

Of the condition and prospects of the Negroes in the various countries into which they have been imported during the prevalence of the slave-trade, we have scarcely room to speak. They are found in all the West India Islands, to the number of about 3,000,000; in the United States, Brazil, Peru, and other parts of South America; also in the Cape de Verde Islands, Arabia, Morocco, &c. In the British West India Islands they were emancipated from slavery in 1834, and in those belonging to France in 1848. Indeed, slavery now exists nowhere in the West Indies, with the single exception of Cuba. In the United States, the Negroes amounted in 1870 to 4,880,000. Many of these were emancipated in the course of the late unhappy civil war, all the Negroes of Secession masters being declared emancipated by proclamation of President Lincoln and act of the Federal congress; at the same time that indemnities were promised to such loyal states as of their own accord decreed emancipation. Negro slavery in the United States has been utterly destroyed, and the great problem which used to exercise philanthropic minds, has been solved—the Negro having become a United States citizen at a fearful cost of blood and treasure to both their possessors and their liberators.

**NEGROPONT.** See EUBŒA.

**NEGROS, ISLA DE.** See PHILIPPINE ISLANDS.

**NEGU'NDO**, a genus of trees of the natural order *Aceraceæ* (see MAPLE), differing from the maples chiefly in the dioecious flowers being destitute of petals, and in the pinnated ash-like leaves. The COMMON N. or ASH-LEAVED MAPLE, is a native of North America, and now not unfrequent in Britain as an ornamental tree.

**NEGUS**, a compound of either port or sherry wine and hot water sweetened with sugar and flavoured with lemon-peel and spices. It is a favourite beverage in England, and derives its name from a Colonel Negus, who claimed to be the inventor.

**NEHEMIAH**, son of Hachaliah, probably of royal descent, is first mentioned in the Bible as upreacher to Artaxerxes Longimanus in his palace at Shushan about 444 B.C. Having learned the

sad fate of the returned colonists in Jerusalem, he prevailed upon the king to send him to his brethren there with full powers 'to seek their welfare.' For twelve years (444—432), he was untiringly engaged as 'Governor' in works for their safety from within and without: refortifying the city walls, notwithstanding the hindrances and dangers that beset him on all sides; inducing people from the country to take up their permanent abode in the city, thus promoting its prosperity; and finally, and above all, rekindling the flame of ancient piety and the enthusiasm for the observance of the Law in the hearts of the rough immigrants. He then returned to Persia, trusting to the new vitality which his reforms had, as he thought, infused into the Jewish commonwealth. But not long afterwards—within a period which it is extremely difficult now to fix—he had again to obtain leave from the king, for the purpose of abolishing the many abuses that had crept in during his brief absence from Jerusalem. His energies now were chiefly directed against the foreign elements mixed up with the people, both privately and publicly. He enforced the rigorous observance of Feast and Sabbath, and rearranged the Temple service in accordance with its primeval purity, procuring at the same time the means for its proper support by inducing the people to offer the tithes as of old. His second stay at Jerusalem seems to have lasted between ten and fifteen years; but the dates, as gathered from circumstantial evidence only, are exceedingly vague. He seems to have lived to an old age, but the place and year of his death are unknown. What was the part he took in the formation and redaction of the biblical canon, cannot be investigated in this place. But there can hardly be a doubt, that among the reformatory works undertaken by him, the collection, and perhaps the edition of some of the books of the Old Testament must be included.

The Book known under his name (in 13 chapters) is believed only partly his own work. Recent investigation ascribes to him only the first six chapters, part of the seventh, and the last chapter and half; the rest being a compilation by other hands. Its style and character are very simple, free from anything supernatural or prophetic. Its language resembles much that of Chronicles and Ezra, and is replete with Aramaisms and other foreign, partly Persian words. Originally considered a mere continuation of the Book of Ezra, it was by the Greeks and Latins at first called 'The Second Book of Ezra.' Gradually, however, it assumed its present independent position in the canon after Ezra. It is supposed to have been written or compiled towards the end of N.'s life.

**NEILGHERRY** (properly **NILGIRI**) **HILLS** (Skr. *nila*, blue, and *giri*, mountain), a remarkable group of mountains in the south of Hindustan, entirely isolated, with the exception of a precipitous granite ridge, 15 miles in width, which connects it with the high table-land of Maisur on the north. Lat. 11° 10'—11° 38' N., long. 76° 30'—77° 10'. The shape of the group is that of a triangle, of which one side faces the district of Malabar on the west. Greatest length, about 40 miles; average breadth, about 15 miles. The base of the mountains is covered by a dense and unhealthy forest, swarming with wild animals, among which are the elephant and tiger; but in the higher regions of the Hills, wood is comparatively scanty. The surface of the group is undulating, rising, in the peak of Dodabetta, near the centre, to the height of 8760 feet, the greatest height, as yet ascertained, in India south of the Himalayas. The Hills for the most part consist of granite, covered often to the depth of

is intensely dry, and the mean annual temperature is 58°.

**NEILGHERRY NETTLE** (*Girardinia Leschenaultii*), a plant of the natural order *Urticaceæ*, nearly allied to the true nettles, and possessing in a high degree the stinging power which is common in them. It is frequent on all the higher ranges of the Neilgherry Hills. The bark yields a valuable fibre, which the natives obtain by first boiling the whole plant, to destroy its stinging properties, and then peeling the stalks. The fibre is of great delicacy and strength, and is worth £200 a ton in England. The cultivation of the plant is therefore thought likely to be remunerative.—Markham's *Travels*.

**NEIRA.** See **MOLUCCAS**.

**NEI'SSE**, a town of Prussian Silesia, and a fortress of the second rank, is situated in a broad valley on the Neisse, an affluent of the Oder, 30 miles south-west of Oppeln. It consists of the town proper on the right bank, of the Friedrich's Town, and of the Preussen Fort on the left bank. It contains two great squares, has eight Catholic and two Evangelical churches, a hospital, theatre, &c. It carries on manufactures of arms, chemical products, and tobacco, and establishments for spinning and weaving are in operation. The entire population in 1871 was 19,376. N., formerly the chief town of a principality of the same name, and the residence of a prince-bishop, has frequently been the scene of conflict.

**NEJIN**, an ancient town of Little Russia, in the government of Tchernigof, on the Oster, an affluent of the Dnieper, about 80 miles north-east of Kiev. It fell into the hands of the Lithuanians in 1320, and of the Poles in 1386, but was annexed to Russia in 1654. N. is an industrious town of 20,516 inhabitants, many of whom are Greek immigrants, who settled here during the reign of Catharine II. The principal branch of industry is the cultivation of tobacco. Great quantities of leaf-tobacco are sent hence to St Petersburg, Riga, and Mittau. The chief institutions are two monasteries, 25 churches, and a lyceum.

**NELSON, HORATIO**, the greatest of Britain's admirals, was born on the 29th September 1758, at Burnham Thorpe, Norfolk, of which place his father, Edmund Nelson, was rector. His mother's maiden

name was Catherine Sutherland. He was a very signal exploit having prominently before the public advent of the war with revolution time had come when he was to shine on the world by a series of exploits of which all other nations were proud. In his obscurer years, he seems to have been under what pained him as a failure, that prescience of a grand day often preluded to a career of glory. Thus, on one occasion he wrote to his mother, "I have not done me justice. By day I'll have a gazette of my exploits, and frequently the same confidence is placed in me like the depth of a religion; day or other I will have a laurel wreath. I feel that such an opportunity cannot, if I am in the field of battle, be missed; wherever there is anyt Providence is sure to direct me." He was appointed to the *Agamemnon*, a distinguished part, among other ships, at the sieges of Bastia and Calvi, in 1794. He was an eye at the last of these; an action of Sir John Jervis with the Spanish fleet, to a great victory, and masterly daring, executed with defiance of orders, that rendered him indebted for the splendid success to the peerage with which it was rewarded. In the interval an expedition against Teneriffe had failed due to himself of his right arm in the battle of the Nile. All hands admitted that ever the occasion which skill and valour in combination could effect, and which England in 1797, was received with acclamation. He was invested with the Bath, and a pension of £1000 a year. Being next year intrusted with the command, he signalled this his first independent command by the stupendous victory of the Nile, memorable in naval annals for the annihilation of an enemy on a scale never before. Finding the French fleet—too considerably inferior in force—to be able to defy ordinary attack, he

Baron Nelson of the Nile, and a grant year for his own life, and the lives of immediate successors. For his services subsequent, in effecting the expulsion of the French from Naples, the Neapolitan king gave him with the Dukedom of Bronte and of £3000 a year. These last honours, were in one sense dearly purchased. The decision of a blot on his public fame of his relations with the corrupt court and of certain questionable acts into these he was led. The only flaw in character was his infatuated attachment to Lady Hamilton, the wife of the English admiral, a woman of questionable antecedents, a fascination, with whom he was in constant contact. The influence which she now exercised over him, she continued to the end of his life he had married, and married to the charms of an impure adventuress. On his return to England, the wife to whom he had been tenderly devoted, it is not to indulge in comment. Let us compassionate the cruel frailty of a man in all else of proper nature, as gentle and generous as a hero.

His magnificent exploit was the battle of Trafalgar, in 1801, in which, after a struggle of great severity, he shattered the naval power of France and along with it the dreaded coalition of the three northern kingdoms. It was the characteristic and heroic qualities of Nelson more brilliantly displayed than on this great occasion. In the moral courage and constancy at all hazards, no man ever surpassed him. In the heat of the battle, his chief, Lord Parker, in deadly anxiety as to the issue of the distance seemed to be a hopeless comrade, he called him to discontinue action. 'Damn it,' said N., when this was reported to him. 'I am for closer battle flying. That's the way to give such signals. Nail mine to the mast, I care not for the certainty of professional disgrace and death if I am in the face in case of failure, he will witness his grand triumph.

His services here ceased, his fame would be eternally assured as the greatest of England's naval heroes. But a crowning glory awaited him. The fiercer part of 1805, glowing with fierce patriotism, he had chased half round the globe a French fleet of nearly double the size of his own, scared by the very terror of his name. On the morning of the memorable day of that year, the desire of his eyes was gratified, when in the Bay of Trafalgar he met him the combined navies of France moving to meet him in frank fight. Of the consummation which followed, we need not go into detail. Ere night, the power of France as a naval power was annihilated, and her threatened empire in England had become an abortive dream.

There was no more. He died as such men wish to die, in the thunders of his mightiest victory. The character of N. was, for a man of his great age, unusually simple and transparent. A more singleness of aim and aspiration than is usually found even to conceive of. Literally on that arduous and passion of enthusiasm, the tincture of which scarce any man has ever yet achieved distinction, he was fixed imperiously in one direction. The sailors—he was a sailor and little else. His genius for command, it would be idle to deny. In coolness, foresight, promptitude, decisive decision, and a daring which, even seemed at times to touch temerity, was

yet regulated throughout by the nicest calculations of reason, he has perhaps never been quite equalled on the element. His nature was most noble and humane. His heart was as soft as a woman's, and overflowed with all liberal generousities. He had but to be known to be beloved; and of the tender chivalry of his relations with his gallant brethren in arms, it is touching to read.

**NELUMBO** (*Nelumbium*), a genus of aquatic plants similar to Water Lilies, and often included under that name, as well as by some botanists in the natural order *Nymphaeaceae* (q. v.); although by others constituted into a distinct order, *Nelumbiaceae*, differing in the want of albumen in the seed, and in the distinct carpels, which are one-seeded, and buried in the cavities of a large fleshy receptacle; which eventually becomes a broad hard bed, full of holes, with the large seeds half buried in them. The flowers and leaves are very similar to those of water-lilies. The species are few, and are found in the warm parts of Asia, in the north of Africa, and in North America. They are all distinguished by the beauty of their flowers. *N. speciosum* is the EGYPTIAN BEAN of Pythagoras,

*Lotus (Nelumbium speciosum)* :

A, the ripe receptacle of *Nelumbium speciosum*; B, a seed; C, a seed, with the two cotyledons so separated as to show the large plumule which they enclose.

the *Lotus* (q. v.) of the Hindus, held sacred by them and by the people of Thibet. It is also much esteemed and cultivated in China, and elsewhere in the East, for its seeds, roots, leaf-stalks, and flower-stalks, all of which are eaten. It has been used as food by the Egyptians from remote antiquity. The seeds are in size and shape like acorns, with a taste more delicate than that of almonds. The root contains much starch, and *Chinese arrow-root* is said to be obtained from it. Slices of it are often served up at table in China. Great quantities are pickled with salt and vinegar, and eaten with rice. The powdered root makes excellent soup with water or milk. The flowers are generally rose-coloured, seldom white. The ancient Egyptian mode of sowing this plant, by enclosing each seed in a ball of clay, and throwing it into the water, is practised at the present day in India.—*N. luteum* is a North American species, extending almost as far north as Philadelphia; with yellow flowers. The seeds are sought after by children and by Indians, and the farinaceous roots are agreeable when boiled.

**NEMATELMIA** (derived from the Gr. words *nema*, a thread, and *helmins*, an intestinal worm) is the term given by recent zoologists to a large and important class of the subdivision *Vermes* of the *Articulata*. The worms belonging to this class are

in the skin, in the shape of canals, in which the nutrient fluid is propelled by the movements of the body. No distinct respiratory organs can be detected; but in some genera there are glands whose object is not clearly known. These worms are unisexual; but the males are comparatively rarely found, and are always smaller than the females. With the exception of two families—the *Urolabea* and *Anguillulidæ*, or paste and vinegar eels—all the animals of this class are parasitic; indeed, Carus, in his *Handbuch der Zoologie* (1863), vol. ii. p. 458, goes so far as to say that 'probably all the nematelmia live as parasites, either during their whole lives or during certain stages of their existence.'

The N. are sometimes termed *Round-worms*, just as the *Platyelmia* (tape-worms, flukes, &c.) are called *Flat-worms*. Most commonly, however, the term round-worm is restricted to the *Ascaris lumbricoidea*, the most common of the human entozoa.

This class is divisible into three very distinct orders—viz., the *Acanthocephala*, which are destitute of an intestinal canal; the *Gordiacea*, which possess an intestinal canal, but no anus; and the *Nematodea*, which possess a perfect intestinal canal, provided with two orifices.

NEMATODEA constitute the highest order of the Nematelmia, and indeed of intestinal worms generally, inasmuch as they present a distinct nervous system, a complete intestine provided with mouth and anus, and distinct sexual organs. The history of their development is not fully known; but there is no reason to believe that these animals undergo any remarkable metamorphoses, although some perforate the intestinal walls, and become encysted in parenchymatous organs. The great majority of the N. are parasitic. The N. are divided by Carus into twelve families, all the members of which are known only in a parasitic state of existence, excepting certain genera of the first and second family.

Although the intestinal canal is the most common residence of these worms, some, as *Trichina spiralis*, are found chiefly in the muscles; others, as *Filaria medinensis*, in the subcutaneous cellular tissue; and others in the kidneys, lungs, &c. See ENTROZOA. For further information regarding these worms, the reader is referred to Eberth's *Untersuch-*

to this length, is capable of itself to three or four feet similar to that of leeches. These annelids feed upon them out of their shells. the mud or sand of the sea-drawn up with the nets or li twine themselves into knot inextricable, but without . The life-history of the *Nem* embryo has at first a ciliat body; from which there i contractile worm, leaving b and this worm grows to the . The larval state, however, raised edges, which become perfect animal.

NEMESIS, according to of Night, was originally the moral feeling of right and actions—in other words, of wards, when an enlarged exp that a Divine will found root the little occurrences of hum regarded as the power who restores the moral equilibrium preventing mortals from reaching perity which would lead them due to the immortal gods, wholesome calamities in the m Hence originated the latest of N., as the being to wh execution of the decrees o providence—the awful and wrong, who punishes and b doers in particular. N. was to Atë (q. v.) and the Eume sometimes called Adrastæa, latter designation being deri village of Attica, where she b represented in the older tin resembling Venus; in later the tunic and peplus, somet hands and a wheel at her fo his right paw upon the w chariot drawn by griffins. on coins and gems.

Round, is a striking object, and the court-jail, barrack, and union workhouse are among edifices. There is a free school, and three national schools. Among the not very numerous manufactures at N., are woollens, tobacco, and candles. It is, however, a place of very considerable inland trade.

**NEOPHYTE** (Gr. *neophytos*, from *neos*, new, and *phuton*, to grow), the name given in early ecclesiastical language to persons recently converted to Christianity. The word is used in this sense by St Paul (1 Tim. iii. 6), and is explained by St Gregory the Great as an allusion to 'their being newly planted in the faith' (Epp. b. v. ep. 51). It differed from *Catechumen* (q. v.), inasmuch as it supposed a person to have not only embraced the doctrines of the church, but also to have received baptism. Still, in the passage referred to, directs Timothy to promote a neophyte to the episcopate; and this prohibition was generally maintained, although occasionally disregarded in very extraordinary circumstances, such as those of St Ambrose (q. v.). The institution of this exclusion was left for a time to the discretion of bishops; but several of the ancient councils legislated regarding it. The third council of Carthage, in 418, and the third of Orange in 529, fix a year as the least limit of probation. In the modern Roman Catholic Church the same discipline is observed, and extends to persons converted not alone from Paganism, but from any sect of Christians separated from the communion of Rome. The time, however, left to be determined by circumstances. The neophyte is also applied in Roman usage to *ordained priests*, and sometimes, though more rarely, to the *novices* of a religious order.

**NEO-PLATONISTS**, the name given to an enormous succession of ancient philosophers who attempted to found their doctrines and speculations upon those of Plato. Strictly speaking, however, the term applies to a philosophy—that is, in its original and true form—expired with Plato's immediate disciples, Speusippus and Xenocrates. Arcesilaus, the founder of the New Academy, and at a later period Carneades (q. v.), introduced and propagated a sceptical *Probabilism*, which gradually lost that earnest and reverent spirit of intellectual inquiry so characteristic of the great Plato and Socrates. The course of political events in the ancient world also largely assisted in bringing about the same result. The triumphs of the Roman Empire had been accomplished at the expense of civil liberties, and had issued in a general deterioration of moral character, both in the East and West. Public men, especially, sought, above all things, material gratifications, and came to look upon philosophy itself as only a more exquisite kind of luxury. It was quite natural, therefore, that the old Platonic and Eclecticisms should become the pretexts of philosophy. Besides, the speculations of the older philosophers were felt to be defective. When men began to review the succession of contradictory or divergent systems that had prevailed since the time of Thales of Miletus, in the gray dawn of Greek history, and to appear to have sprung up that reality, truth, was either not attainable, or could only be attained by selecting something from every system.

Moreover, the immensely extended intercourse of nations, itself a result of Roman conquest, brought into the closest proximity a crowd of conflicting opinions, beliefs, and practices, which could not help occasionally undergoing a confused amalgamation, and in this way presented to view a kind of eclecticisms, less refined and philosophical than the speculative systems of the day, but

not essentially different from them. This tendency to amalgamation shewed itself most prominently in Alexandria. Placed at the junction of two continents, Asia and Africa, and close to the most cultivated and intellectual regions of Europe, that celebrated city naturally became a focus for the chief religions and philosophies of the ancient world. Here, the East and the West, Greek culture and Oriental enthusiasm, met and mingled; and here, too, Christianity sought a home, and strove to quell, by the liberality of its sympathies, the myriad discords of Paganism. 'Greek Scepticism,' says Mr Lewes, 'Judaism, Platonism, Christianity—all had their interpreters within a small distance of the temple of Serapis.' It is not wonderful, therefore, that a philosophy, which so distinctly combines the peculiar mental characteristics of the East and the West, as that promulgated by the Neo-Platonists, should have originated in Alexandria. Yet, at the same time, it is but right to notice, as does M. Matter in his *Histoire de l'Ecole d'Alexandrie*, that it soon ceased to have any local connection with the city. Its most illustrious representatives were neither natives of Alexandria, nor members of the famous Museum, and they had their schools elsewhere—in Rome, in Athens, and in Asia.

It is not easy to say with whom *Neo-Platonism* commenced. Scholars differ as to how much should be included under that term. By some it is used to designate the whole new intellectual movement proceeding from Alexandria, comprising, in this broad view, the philosophy, 1st, of Philo-Judæus and of Numenius the Syrian; 2d, of the Christian Fathers (Clemens Alexandrinus, Origen, &c.); 3d, of the Gnostics; and 4th, of Ammonius Saccas and his successors. Others, again, would exclude the second of these (though the Alexandrian divines frequently Platonise); while a third party is disposed to restrict the application of the term to the fourth. The last of these modes of regarding Neo-Platonism is the one most current, and is perhaps the most convenient and definite; yet Bouterwek, Tennemann, Lewes, &c., agree in considering Philo-Judæus (q. v.), an Alexandrian Jew, and (in part) contemporary of Jesus Christ, as the first of the Neo-Platonists—that is to say, as the first who endeavoured to unite the mysteries of Oriental belief with the dialectics and speculations of the Platonists. A similar course was at least partially pursued by the Christian fathers of Alexandria, partly from a predilection for the philosophy in which they had been reared, and partly from a desire to harmonise reason and faith, and to make their religion acceptable to thoughtful and educated pagans; hence, they too may, not without reason, be classed along with Philo, though their spirit and aim are distinctively and even strongly Christian. In Gnosticism, on the other hand, speaking generally, the lawless mysticism of the East predominated, and we see little either of the spirit or logic of Plato. They may therefore be dismissed from the category of Neo-Platonists. Regarding Philo-Judæus and the Alexandrian divines, it must be noticed that they wrote and taught in the interests of their own religion, and had no idea of defending or propagating a heathen philosophy. It is this which strikingly distinguishes them from the school founded by Ammonius Saccas, and also from an independent group of pagan teachers and authors who likewise flourished in the first and second centuries after Christ, and whose main object was to popularise and diffuse the ethical and religious-philosophic system of Plato, by allegorically explaining the ancient mysteries of the popular belief in harmony with the ideas of their master, but, at the

same time, blending with these many Pythagorean and Aristotelian notions. The best-known names of this group are Plutarch (q. v.) and Appuleius (q. v.). These men have a better claim to the title of Neo-Platonists than any of the others. They adhered far more closely to their great master, and were, in fact—to the best of their ability—simply popular expounders of his philosophy. Living at a time when paganism was in a moribund condition, they sought to revive, purify, and elevate the faith in which their fathers had lived. Christianity, a young, vigorous, and hostile system, was rooting itself in the hearts of men deeper and deeper every day, and these disciples of Plato—tenderly attached to their ancestral religion—felt that something must be done to preserve from going out the fires that were feebly burning on the altars of the ancient gods.

But these commentators and expositors of Plato were not remarkable for their philosophical power; a fresh stream of life was first poured into the old channels of Platonic speculation by Ammonius Saccas (q. v.) and Plotinus (q. v.), and it is this fact which gives the school which they established its best claim to the exclusive title of *Neo-Platonist*. 'In no species of grandeur was the Alexandrian school deficient,' as M. Saissset justly observes: 'genius, power, and duration have consecrated it. Re-animating during an epoch of decline the fecundity of an aged civilisation, it created a whole family of illustrious names. Plotinus, its real founder, resuscitated Plato; Proclus gave the world another Aristotle; and in the person of Julian the Apostate, it became master of the world. For three centuries it was a formidable rival to the greatest power that ever appeared on earth—the power of Christianity; and if it succumbed in the struggle, it only fell with the civilisation of which it had been the last rampart' (Lewes's *Biog. Hist. Phil.* p. 259). The essence of all the Alexandrian speculations, we have stated, consists in the blending of Platonic ideas with Oriental mysticism; the peculiarity of the *Neo-Platonists*, strictly so-called, lies simply in the novelty, audacity, and ingenuity of their reasonings. They aimed at constructing a religion on a basis of dialectics. They strove to attain a knowledge of the Highest, and the way in which they endeavoured to accomplish this was by assuming the existence of a capacity in man for passing beyond the limits of his personality, and acquiring an intuitive knowledge of the absolute, the true—that which is beyond and above the fluctuations and dubieties of 'opinion.' This impersonal faculty is called *Ecstasy*. By means of it, man—ceasing, however, it should be observed, to be individual man, i. e., himself—can identify himself with the Absolute (or Infinite). Plotinus, in fact, set out from the belief that 'philosophy' (i. e., 'Absolute Truth') is only possible through the identity of the thinker, or rather of the subjective thought, with the thing thought of, or the objective thought. This intuitive grasp or 'vision' of the Absolute is not constant; we can neither force nor retain it by an effort of will; it springs from a divine inspiration and enthusiasm, higher and purer than that of poet or prophet, and is the choicest 'gift of God.'

The god of Plotinus and the other Alexandrians is a mystical Trinity, in the exposition of which they display a dialectical subtlety that even the most ingenious of the schoolmen never reached. The Divine Nature contains within it three Hypostases (Substances); its basis, if we may so speak, is called Unity, also poetically Primitive Light, &c. This Unity is not itself any thing, but the principle of all things; it is absolute good, absolute perfection; and though utterly incapable of being conceived by

the understanding, there is that in man that assures him that it—the incomprehensible, the ineffable, &c. 'It has neither quantity nor quality; neither reason nor soul; it exists neither in motion nor repose; neither in space nor time; it is not a numeric unity nor a point; . . . it is pure law without Accident; . . . it is exempt from all want or dependency, as well as from all thought or will; it is not a thinking Being, but Thought itself—the principle and cause of all things.' To the saints this 'Primitive Light,' we are afraid, will seem very luminous. From 'Unity,' as the primordial source of all things, emanates 'Pure Intelligence' (*Nous*—the *Vernunft* of modern German metaphysics); its reflection and image, that by which it is intuitively apprehended; from Pure Intelligence, in turn, emanates the 'Soul of the World' (*Psyche tou pantos*), whose creative activity produces the souls of men and animals, and 'Nature'; and finally, from Nature proceeds 'Matter,' which, however, is subjected by Plotinus to such refinement of definition that it loses all its grossness. Unity, Pure Intelligence, and the World-Soul thus constitute the Plotinian Triad, with which is connected, as we have seen, the doctrine of an eternal Emanation, the necessity of which he endeavoured to demonstrate by the most stringent logic. Human souls, whose source is the Pure Intelligence, are—by some mysterious fate—imprisoned here in perishable bodies, and the higher soul is ever striving to reascend to their original home. So Plotinus, when in the agonies of death, said calmly to his friends: 'I am struggling to liberate the divinity within me.'

The most distinguished pupil of Plotinus was Porphyrius (q. v.), who mainly devoted himself to expounding and qualifying the philosophy of his master. In him we see, for the first time, the presence of a distinctively anti-Christian tendency. Neo-Platonism, which can only be properly understood when we regard it as an attempt to place Paganism on a philosophical basis—to make its Greek religion philosophical, and Greek philosophy religious—did not consciously set out as the antagonist of Christianity. Neither Ammonius Saccas nor Plotinus assailed the new faith; but as the latter continued to grow, and to attract many of the most powerful intellects of the age into its service, this latent antipathy began to show itself. Porphyry wrote against it; Iamblichus (q. v.), the most noted of his pupils, did the same. The latter also introduced a theurgic or 'magical' element into Neo-Platonism, teaching, among other things, that certain mysterious practices and symbols exerted a supernatural influence over the divinity, and made them grant our desires. Magic is always popular, and it is therefore not wonderful that Iamblichus should have had numerous followers. Iamblichus succeeded to his master's chair, and appears to have had also a considerable number of disciples. To the school of one of them the Emperor Julian belonged, whose patronage for a moment shed a gleam of splendour over Neo-Platonism, and seemed to promise it a universal victory. After a succession of able, but not always consistent teachers, we reach Proclus (q. v.), the last great Neo-Platonist, who belongs to the 5th c., a man of prodigious learning, and of an enthusiastic temperament, in whom the pagan-religious, and consequently anti-Christian, tendency of the Neo-Platonic philosophy culminated. His ontology was based on the Triad of Plotinus, but was considerably modified in detail; he exalted 'Faith' above 'Science' as a means of reaching the Absolute Unity; was a believer in Theurgy, and so naturally laid great stress upon the ancient Chaldean oracles, Orphic hymns, mysteries, &c., which

regarded as divine revelations, and of which he derided himself—as, indeed, he was—the last ‘interpreter.’ His hostility to the Christian on was keen; in its success he saw only triumph of a vulgar popular superstition over refined and beautiful theories of philosophy; as as if he beheld a horde of barbarians using the statues and records of the Pantheon. Disciples of Proclus were pretty numerous, but remarkable for high talent. Perhaps the ablest successors was Damascius, in whose time the error Justinian, by an arbitrary decree, closed schools of the heathen philosophers. ‘The ns,’ says Cousin (*Cours d’Histoire de la Philosophie Moderne*), ‘of fierce retaliation, and of an acute persecution, these poor Alexandrians, having sought an asylum in their dear East, the court of Chosroes, returned to Europe (533), were dispersed over the face of the earth, and most part extinguished in the deserts of Egypt, where they were converted for them into a philosophic class.’ See Fichte, *De Philosophia Nova*; *Origine* (Berl. 1818); Bouterwek, *Philosophum Alexandrinorum ac Neo-Platoniorum, vita accuratior* (Gött. 1821); Matter, *Essai critique sur l’Ecole d’Alexandrie* (2 vols. Par. 1845); Simon, *Histoire de l’Ecole d’Alexandrie* (2 Par. 1845); Barthélemy St Hilaire, *De l’Ecole d’Alexandrie* (Par. 1845); Lewes, *Biographical Essay of Philosophy* (1857); and Ueberweg’s *History of Philosophy* (Translation, Hodder and Stoughton: 1872).

NEOZOIC (Gr. new life), a term introduced by Sir Charles Lyell and Forbes to include all the strata from the Tertiary to the most recent deposits. They are generally divided into the two great groups of Secondary and Tertiary Rocks. This division is, however, arbitrary—the chief point of difference depending on the occurrence in the Tertiary deposits of fossils supposed to be the same as some still living. There is no palæontological nor petrological break between the Tertiary and the Permian series. Forbes, accordingly, suggested the obliteration of the division between the Secondary and Tertiary series, and the division of all geological strata into two epochs—the Palæozoic and the Neozoic.

NEPAL AND NEPIDÆ. See WATER-SCORPION.

NEPAL, an independent kingdom of Hindustan, rises a portion of the southern slope of the Himalayas, is bounded on the N. by Tibet, on the W. by British India, and on the E. by Sikkim, a protected state. Long. 80° 15′–88° 15′ E. It is 150 miles in length, by about 100 miles in average breadth. Area, 54,000 square miles; pop. estimated 1,000,000. The kingdom is separated from the rest of India by the long narrow strip of land, called an English down, but unhealthy, called Terai, which extends along the whole southern frontier. North of this, and running parallel with the great forest of N., from 8 to 10 miles wide. North of this strip is a tract of hilly country, and above that are two tracts of greater elevation, the first of which may be called mountains, while the second might appropriately be called Alpine, if it did not comprise among its peaks, which, like Mount Everest and Annapurna, attain almost twice the elevation of the Alps. The principal rivers are the Kurnali, the Gandak with its great tributaries, the Sun Kosi. The climate, most unhealthy in the Terai, is healthy and pleasant in the hilly and mountainous districts, suggesting that of Southern France. In the Valley of N.—the district surrounding the capital—the heat of Bengal, which is felt in

the hollows, may be exchanged for the cold of Russia by ascending the slopes of the hills which enclose it. The soil is extremely rich and fruitful. Barley, millet, rice, maize, wheat, cotton, tobacco, sugarcane, pine-apple, and various tropical fruits are cultivated. Gold has not been found, but iron and copper mines are worked. The inhabitants consist mainly of two tribes—the Ghurkas, whose chief occupation is war, and the Newars, who are principally artisans. The capital of the country is Khatmandu (q. v.).

NEPENTHES, the only known genus of a natural order of exogenous plants called *Nepenthaceæ*, consisting of herbaceous or half-shrubby plants with dioecious flowers, natives of swampy ground in India and China, chiefly remarkable for their leaves. Each leaf consists of a dilated foliaceous petiole, prolonged beyond its foliaceous part, as if it were the prolongation of the midrib of a leaf,

Pitcher Plant (*Nepenthes distillatoria*).

and terminating in a pitcher (*ascidium*), from which the name PITCHER PLANT has been very generally given to the species of this order. The pitcher is terminated by a lid, which is regarded as the true blade of the leaf. The fluid found in these pitchers is probably in some way needful for the nourishment of the plant, and is a secretion of the plant itself. It varies much in quantity. Insects often enter the pitcher, and are drowned in it. It contains binxalate of potash. Pitcher plants (*N. distillatoria*) are not uncommon in our hothouses.

NEPHELIUM. See LITCHI.

NEPHRITE, a mineral which is not unfrequently called Jade (q. v.), and of which Axestone (q. v.) is very generally considered a variety. It is composed of silica, magnesia, and lime; is compact, with a coarse splintery fracture, very tenacious, sometimes translucent, greasy to the touch, and of a green or greenish colour. It is found in granite, gneiss, greenstone, &c., in many parts of the world. Very fine specimens are brought from Persia, Siberia, and China, and are known as *Oriental Jade*. The kind called *Indian Jade* is olive green, and strikes fire with steel; that from China is whitish, and does not strike fire. N. is used for ornaments. The Turks make it into handles for sabres and daggers. Many imaginary virtues were once ascribed to it, such as the cure of epileptic fits and of nephritic (Gr. *nephros*, kidney) complaints; hence its name.

**NEPHRITIS** (Gr. *nephros*, kidney), inflammation of the Kidneys (q. v.).

**NEPOMUC.** See **JOHN OF NEPOMUK.**

**NEPOS, CORNELIUS**, a Roman historian, born in the 1st c. B. C., but the place and precise time of his birth are unknown. He was the friend of Cicero and Catullus. The only work of N.'s which has survived (if indeed it be his), is a series of twenty-five generally brief biographies of warriors and statesmen, mostly Greeks. These biographies are distinguished by the purity of their Latinity, the conciseness of their style, and their admirable exhibition of character, but sufficient care has not been exercised in the examination of authorities, nor is the relative importance of things duly regarded. Until the middle of the 16th c., these biographies, on the strength of the titles given in the various MSS., were generally ascribed to *Æmilius Probus*, a writer who lived in the latter part of the 4th c.; but in 1569, an edition was put out by the famous *Dionysius Lambinus*, who pronounced the so-called *Lives* of *Æmilius Probus* to be in reality the lost work of *Cornelius Nepos*, *De Viris Illustribus*. His weightiest argument is drawn from the excellence of the Latin, and the chastity of the style, so unlike the corrupt and florid language of the Decline. Many critics hold that these *Lives* ought to be regarded as an abbreviation of the work of N. by *Probus*. This hypothesis is not without its difficulties, but it is perhaps the least objectionable of any. There are many editions, among which may be mentioned those of *Van Staveren* (Leyd. 1773), of *Tzschucke* (Gott. 1804), and of *Bremi* (Zur. 1820); and the book is in general use as a school-book. It has been very frequently translated into English and other languages.

**NEPTUNE**, an ancient Italian god. It is doubtful whether he was originally a marine deity at all,

Neptune.

for the old Italians were the very opposite of a maritime people, yet his name is commonly connected with *nato*, to swim; hence at an earlier period he may have borne another designation, afterwards forgotten. When the Romans became a maritime power, and had grown acquainted with Grecian mythology, they, in accordance with their usual practice, identified him with the Greek god whom he most resembled. This was *Poseidōn*, also *Poteidan* (connected with *potos*, a drink, *pontos*, the sea, and *potamos*, a river). *Poseidon* appears in his most primitive mythological form as the god of water in general, or the fluid element. He was the son of *Cronos* (*Saturn*) and *Rhea*, and a brother of *Jupiter*. On the partition of the universe amongst the sons of *Cronos*, he obtained the sea as his portion, in the depths of which he had his palace near *Ægæ*, in *Eubœa*. Here also he kept his brazen-hoofed and golden-maned steeds, in a chariot drawn by which

he rode over the waves, which grapple at his approach, while the monsters of the deep, rising their lord, made sportive havoc on his watery path. But he sometimes presided at the assembly of the gods on *Olympus*, in conjunction with *Apollo*, built the walls of *Trojan* war he sided with the *Greeks*, though he subsequently shewed him the great sea-wanderer *Ulysses*, with his son *Polyphemus*. He was a powerful deity, having created the horse, and taught the art of riding. The symbol of his power was a trident, which he raised and stilled storms, &c. According to *Herodotus*, the name of *Poseidon* came to the *Greeks* from *Italy*, especially in the seaport of *Isthmia*, where games were held in his honor, and white bulls, boars, and rams were sacrificed to him. N. was commonly represented with a trident, and with horses or chariots, along with *Amphitrite*, in a chariot drawn by dolphins, and surrounded by trident-bearing sea-monsters. As befitted the fluctuant power over which he ruled, he is sometimes depicted as reposing, and sometimes in a state of agitation.

**NERBUDDAH**, a river of *Hindostan*, the *Vindhya* Mountains, at a height of 4000 feet above sea-level, in lat. 21° 52' E. It flows west, past *Jabalpur* from its source, where the great *depot* of the *Vindhya* Mountains on the north of the *pura* Mountains on the south, known as the N., begins. The other principal banks are *Hoshangabad*, *Burwani*, and *Hoshangabad* it is 900 yards wide, and six feet in depth. At *Barnech* it begins to flow into a wide estuary, and after flowing further, it falls into the *Gulf of Cambay*, length about 800 miles, of which it is navigable for river-boats.

**NERCHINSK**, an important town in *Russia*, *Eastern Siberia*, in the *Transbaikalia*, on the *Nercha*, a tributary of the *Amur*, in lat. 51° 58' N., long. 116° 35' E., 40 miles from *St Petersburg*. It was founded in 1765, and has from 4000 to 5000 inhabitants. The *Nercha*, which N. is the centre, yields 2166 tons of *iron* yearly, together with large quantities of *lead*, and *iron*, and precious stones. *Mines* in the empire are worked here, and in the vicinity is fertile, and the climate agreeable.

**NEREIS**, a genus, and **NEREID**, a species, of *Annelida*, having a long slender body, head, with tentacles and eyes; the

Nereis.

covered with tubercles, and the gills are tufted. They are all marine, and are found under rocks or in the sand. They are

by rapid and undulating inflections of the body, and by the aid of numerous oars arranged along the sides; each formed of a stout footstalk, numerous bristles, and a flap. The proboscis is thick, strong, and armed with two jaws.

**NEREITES**, the name given to animals which have left their impress on the Silurian Rocks, and which exhibit a form similar to the modern Nereis. They occur on the surface of the laminae of fine shales, over which, when it was soft, the creature moved, leaving a long and tortuous trail, which is generally found to terminate in a more defined representation produced apparently by the body itself, although every trace of it has disappeared. See *ICHOLOGY*, fig. 2.

**NERI**, PHILIP DE, a saint of the Roman Catholic Church, and founder of the Congregation of the Oratory (q. v.), was born of a distinguished family in Florence, July 21, 1515. His character, even in boyhood, foreshadowed the career of piety and benevolence to which he was destined, and he was commonly known among his youthful companions by the name of 'good Philip.' On the death of his parents, he was adopted by a very wealthy uncle, with whom he lived for some time at San Germano, near Monte Cassino, and by whom he was recognised as his destined heir. But he relinquished all these prospects, for a life of piety and charity, and having come to Rome in 1534, he there completed his philosophical and theological studies, and won the esteem and reverence of all by his extraordinary piety, and his benevolence and activity in every good work whether of charity or of religion. Although he did not receive priest's orders till 1551, he had already been for years one of the most earnest and devoted in all the pious works of Rome for the instruction of the poor, the care of the sick, and the reclamation of the vicious; and in 1550, in unison with several of his friends, he established a confraternity for the care of poor pilgrims visiting Rome, and other houseless persons, as well as of the sick generally, which still subsists, and which has numbered among its associates many of the most distinguished members of the Roman Catholic Church. This confraternity, however, is chiefly noteworthy as having been the germ of the far more celebrated CONGREGATION OF THE ORATORY (q. v.), which was founded by St Philip in concert with his friends Baronius and Tarugio, both afterwards cardinals, Sabriati, and some others. Besides the general objects above indicated, and the spiritual duties designed for the personal sanctification of the members, the main object of this association was the moral instruction and religious training of the young and uneducated, who were assembled in chapels or oratories, for prayer and for religious and moral instruction. As a further means of withdrawing youth from dangerous amusements, sacred musical entertainments (thence called by the name of *oratorio*) were held in the oratory, at first consisting solely of hymns, but afterwards partaking of the nature of sacred operas or dramas, except that they did not admit the scenic or dramatic accompaniments of these more secular compositions. Religious and literary lectures also formed part of his plan, and it was in the lectures originally prepared for the Oratory that, at the instance of N., the gigantic *Church History* of Baronius had its origin. The personal character of N., the unselfish devotedness of his life, his unaffected piety, his genuine love of the poor, his kindly and cheerful disposition, and, perhaps, as much as any of the rest, a certain quaint humour, and a tinge of what may almost be called drollery which pervaded many of his sayings and doings, contributed to popularise his institute,

and to engage the public favour for himself and his fellow-labourers. He himself enjoyed the reputation of sanctity and of miracles among his fellow-religionists almost beyond any of the modern saints; and he may still be described as emphatically the popular saint of the Roman people. He lived to an extreme age in the full enjoyment of all his faculties, and in the active discharge to the last of all the charitable duties to which his life had been devoted. He died at the age of 80, May 26, 1595. He was canonised by Gregory XV. in 1622. His only literary remains are his *Letters* (8vo, Padua, 1751); the *Constitutions* of his congregation, printed in 1612; some short spiritual treatises, and a few sonnets which are printed in the collection of *Rime Oneste*.

**NERIUM**. See **OLEANDER**.

**NE'RO**, Roman emperor from 54 A.D. to 68 A.D., was born at Antium, on the coast of Latium, 15th December 37 A.D., and was the son of Cn. Domitius Ahenobarbus and of Agrippina, the daughter of Germanicus Caesar, and sister of Caligula. His mother becoming the wife of the Emperor Claudius, Claudius adopted him (50 A.D.), and his name, originally L. Domitius Ahenobarbus, was changed to Nero Claudius Caesar Drusus Germanicus. After the death of Claudius (54 A.D.), the Prætorian Guards, at the instigation of Afranius Burrhus, their prefect, declared him emperor, instead of Claudius's son Britannicus, and their choice was acknowledged both by the senate and the provinces. His reign began with the semblance of moderation and good promise, under the guidance of Burrhus and his tutor Seneca the philosopher; but the baleful influence of his mother, together with his own moral weakness and sensuality, frustrated their efforts, and he soon plunged headlong into debauchery, extravagance, and tyranny. He caused Britannicus, the son of Claudius, to be treacherously poisoned at the age of 14, because he dreaded him as a rival, and afterwards (59 A.D.) caused his own mother Agrippina (with whom he was latterly on bad terms) to be assassinated, to please his mistress Poppæa Sabina (the wife of his principal boon-companion Otho, afterwards emperor), in order to marry whom he also divorced and afterwards put to death his wife Octavia (aged 20), the sister of Britannicus. The low servility into which the Roman senate had sunk at this time, may be estimated from the fact that it actually issued an address congratulating the hateful matricide on the death of Agrippina. N. himself, on the other hand, confessed that he was ever haunted by the ghost of his murdered mother. The affairs of the empire were at this time far from tranquil. In 61 A.D., an insurrection broke out in Britain under Queen Boadicea, which was, however, suppressed by Suetonius Paulinus. The following year saw an unsuccessful war against the Parthians in Armenia. At home, matters were not much better. The emperor was lampooned in verse; the senate and priesthood, alike venal, were also satirised by audacious malcontents; Burrhus, a valuable friend, died; and even Seneca, though not a great moralist, out of his books, thought it only decent to remove from court. In July 64, occurred a great conflagration in Rome, by which two-thirds of the city were reduced to ashes. N. himself is usually believed to have been the incendiary. It is said that he admired the spectacle from a distance, reciting verses about the burning of Troy, but many scholars are doubtful whether he really had any hand in it. At all events he laid the blame on the Christians—that mysterious sect, who, like the Jews in the middle ages, were the cause of all otherwise inexplicable calamities, and persecuted them with great fury. Moreover, he rebuilt the

city with great magnificence, and reared for himself on the Palatine Hill a splendid palace, called, from the immense profusion of its golden ornaments, the *Aurea Domus*, or Golden House; and in order to provide for this expenditure, and for the gratification of the Roman populace by spectacles and distributions of corn, Italy and the provinces were unsparingly plundered. A conspiracy against him failed in the year 65, and Seneca and the poet Lucan fell victims to his vengeance. In a fit of passion he murdered his wife Poppæa, by kicking her when she was pregnant. He then proposed to Antonia, the daughter of Claudius, but was refused, whereupon he caused the too fastidious lady to be put to death, and married Statilia Messallina, after killing her husband. He also executed or banished many persons highly distinguished for integrity and virtue. His vanity led him to seek distinction as a poet, a philosopher, an actor, a musician, and a charioteer, and he received sycophantic applauses, not only in Italy, but in Greece, to which, upon invitation of the Greek cities, he made a visit in 67. But in 68, the Gallic and Spanish legions, and after them the Praetorian Guards, rose against him to make Galba emperor, and N. fled from Rome to the house of a freedman, Phaon, about four miles distant. The senate, which had hitherto been most subservient, declared him an enemy of his country, and the tyrant ended his life by suicide, 11th June 68. One is sorry to learn that such a wretch had a taste for poetry, and was skilled in painting and modelling.

NERVA, M. COCCÆIUS, a Roman emperor, elected by the senate after the murder of Domitian, 18th September 96. He was born 32 A.D., of a family belonging to Narnia, in Umbria, and twice held the honour of consulship before his election to the dignity of emperor. He displayed great wisdom and moderation, rectified the administration of justice, and diminished the taxes; but finding himself, upon account of his advanced age, not vigorous enough to repress the insolence of the Praetorian Guards, he adopted M. Ulpius Trajanus, then at the head of the army of Germany, who succeeded him on his death, 27th January 98. After his decease, he obtained an apotheosis.

NERVOUS SYSTEM, THE, is composed in all vertebrated animals of two distinct portions or systems—viz., the *cerebro-spinal* and *sympathetic* or *ganglionic*.

The *cerebro-spinal system* includes the brain and spinal cord (which form the *cerebro-spinal axis*), and the cranial and spinal nerves. It was termed by Bichat the nervous system of animal life, and comprises all the nervous organs concerned in sensation, volition, and mental action.

The *sympathetic system* consists essentially of a chain of ganglia connected by nervous cords, extending from the cranium to the pelvis, along each side of the vertebral column, and from which nerves with large ganglionic masses proceed to the viscera and blood-vessels in the cavities of the chest, abdomen, and pelvis. It was termed by Bichat the nervous system of organic life, since it seems to regulate—almost or quite independently of the will—the due performance of the functions of the organs of respiration, circulation, and digestion.

The essential parts of the *cerebro-spinal axis* are described in the articles BRAIN, CEREBRUM and CEREBELLUM, and SPINAL CORD. The brain and spinal cord are covered and protected by three membranes or *meninges*, as they are frequently termed—viz., the *dura mater*, the *arachnoid*, and the *pia mater*. The *dura mater* is a strong fibrous membrane, which supplies the cranial bones with

blood in early life, and adheres firmly to their inner surface. It is less closely attached to the bony walls of the spinal canal. Inside the cranium it gives off processes (such as the *falx cerebri*, *tentorium cerebelli*, and *falx cerebelli*) which divide and support different parts of the brain; it gives a strong fibrous sheath to every nerve; and by splitting into two layers at certain points, it forms receptacles for venous blood, which are termed *SINUSES* (q. v.). The *arachnoid* (so called from its being supposed to be as thin as a spider's web) is a serous membrane, and, like all serous membranes, is a closed sac, consisting of a parietal and a visceral layer. The parietal layer adheres to the inner surface of the *dura mater*, to which it gives a smooth, polished appearance; while the visceral layer somewhat loosely invests the brain and spinal cord, from direct contact with which, however, it is separated by the interposition of the *pia mater* and some loose areolar tissue. In most regions there is an interval between the visceral layer of the *arachnoid* and the *pia mater*, which is called the *sub-arachnoid cavity*, and is filled during life by the *cerebro-spinal fluid*. This fluid, which varies in quantity from two to ten ounces, keeps the opposed surfaces of the *arachnoid* in close contact, and affords mechanical protection to the nervous centres which it surrounds, and guards them against external shocks. It is accumulated in considerable quantity at the base of the brain, where it serves for the protection of the large vessels and nerves situated there. In fracture of the base of the skull, the draining away of this fluid, often in very large quantity, through the external auditory meatus, is often one of the most significant symptoms. It is doubtless secreted by the *pia mater*, which is the immediate investing membrane of the brain and spinal cord. This membrane consists of minute blood-vessels, held together by an extremely fine areolar tissue. It dips down between the convolutions and fissures of the brain, and is prolonged into the interior, forming the *velum choroideum*, and the choroid plexuses of the fourth ventricle. It is by means of this membrane that the blood-vessels are conveyed into the nervous substance.

We now proceed to notice the nerves connected with the *cerebro-spinal centre* or *axis*. These are usually described in two classes—the *spinal* and the *cranial* or *encephalic*. The former class consists of all those which arise from the spinal cord, and emerge from the spinal canal through the intervertebral foramina; while the latter includes those which arise from some part of the *cerebro-spinal centre*, and emerge through foramina in the cranium or skull.

The *Spinal Nerves* (exclusive of the spinal accessory nerve, which, from the fact that it emerges from the skull, is usually ranked among the cranial nerves) are thirty-one on either side, there being a pair for each pair of intervertebral foramina (whose formation is described in the article VERTEBRÆ AND VERTEBRAL COLUMN), and for the foramina between the atlas (the first or highest vertebra) and the occipital bone at the base of the skull. Every spinal nerve arises from the cord by two roots, an anterior and a posterior, of which the latter is distinctly the larger. Each root passes out of the spinal canal by a distinct opening in the *dura mater*. Immediately after its emergence, a ganglion is seen in the posterior root, and in the anterior surface of this ganglion the anterior root lies imbedded. Just beyond the ganglion, but not at all previously, the nervous fibres of both roots intermingle, and a compound nerve results. The trunk thus formed separates immediately after it has passed through the intervertebral canal into two divisions—the anterior and posterior—each of which contains

# NERVOUS SYSTEM.

filaments from both roots, and possessing, as will be immediately shewn, perfectly different functions. These divisions, of which the anterior is considerably the larger, proceed to the anterior and posterior parts of the body respectively, and are

Fig. 1.—Roots of a Dorsal Spinal Nerve, and its union with the Sympathetic:

a, a', anterior fissure of the spinal cord; a, anterior root; p, posterior root with its ganglion; a', anterior division or branch; p', posterior branch; s, sympathetic; e, its double junction with the anterior branch of the spinal nerve by a white and a gray filament, the respective natures of which are subsequently described.—From Todd and Bowman.

distributed to the skin and the muscles. The anterior branch communicates with the sympathetic nerve, as is shewn in the figure. The mode of connection of the roots of the nerves with the cord is noticed in the article SPINAL CORD. These nerves are arranged in classes, according to the regions of the spine in which they originate, and we thus speak of eight cervical, twelve dorsal, five lumbar, and six sacral nerves on either side.

The discovery of the separate functions of the anterior and posterior roots of the spinal nerves, which has been characterised as the first important step towards a right understanding of the physiology of the nervous system, was made by our distinguished countryman Sir Charles Bell, although there is reason to believe that Magendie, without any knowledge of Bell's experiments, arrived at similar conclusions at nearly the same time. The original experiments consisted in laying open the spinal canal in rabbits, and irritating or dividing the roots of the spinal nerves. It was observed that irritation of the anterior roots caused muscular movement, and that the posterior roots might be irritated without giving rise to any muscular action; while division of the posterior roots did not impair the voluntary power over the muscles. Hence it was inferred that the anterior roots were motor (or conveyed motive power to muscles), and the posterior roots not motor; but it was not fully determined what degree of sensibility remained in parts supplied from the divided roots. Numerous physiologists arrived at similar results to those of Bell; but the most conclusive experiments are those of Müller, who operated on frogs, in which, from the great width of the lower part of the spinal canal, the roots of the nerves can be exposed with great facility. In these experiments, it was found that irritation of the anterior root always excited muscular contraction, while no such effect followed irritation of the posterior root; that section of the anterior root caused paralysis (or loss of power) of

motion, while section of the posterior root caused paralysis of sensation; and that when the anterior roots of the nerves going to the lower extremity were cut on one side, and the posterior roots on the other, voluntary power without sensation remained in the latter, and sensation without voluntary motion in the former. The obvious conclusion to be derived from these experiments is, that the anterior root of each spinal nerve is *motor*, and the posterior *sensitive*. (In place of the terms *sensitive* and *motor*, the terms *afferent* and *efferent* are now frequently used. The functions of the nerves being to establish a communication between the nervous centres and the various parts of the body, and *vice versa*; an *afferent* nerve communicates the impressions made upon the peripheral nervous ramifications to the centres, while an *efferent* nerve conducts the impulses of the nervous centres to the periphery.)

The *Cranial Nerves*, although twelve in number on either side, were arranged by Willis (*Cerebri Anatome; cui accessit Nervorum Descriptio et Usus*, 1664), whose system is still generally adopted, in nine pairs, which, taken from before backwards in the order in which they are transmitted through the foramina at the base of the skull, stand as follows: 1st, Olfactory; 2d, Optic; 3d, Motores Oculorum; 4th, Pathetic; 5th, Trifacial; 6th, Abducentes; 7th, Portio Dura or Facial, Portio Mollis or Auditory; 8th, Glossopharyngeal, Par Vagus or Pneumogastric, Spinal Accessory; 9th, Hypoglossal.

They may be subdivided into three groups, according to their functions—viz. *Nerves of Special Sense*—the Olfactory (see NOSE), Optic (see EYE), and Auditory (q. v.); *Nerves of Motion, or Efferent Nerves*—the Motores Oculorum, Pathetic, Abducentes, Facial, and Hypoglossal; and *Compound Nerves*—the Trifacial, Glossopharyngeal, Pneumogastric, and Spinal Accessory.

The reason why no nerve of Taste is included in the above arrangement amongst the nerves of special sense will be subsequently seen; and we proceed briefly to notice the functions of the motor cranial nerves.

The 3d, 4th, and 6th pairs—the *Motores Oculorum*, *Pathetic*, and *Abducentes*—together make up the apparatus by which the muscles of the orbit (the four Recti, the superior and inferior Oblique, and the Levator Palpebræ) are called into motion, and are sufficiently noticed in the article EYE.

The *Facial Nerve*, or the *Portio Dura* of the 7th pair, is divisible into three stages. The first stage is the intracranial, from its origin to its exit from the cranial cavity, in association with the *Portio Mollis*, or *Auditory Nerve* (q. v.), at the internal auditory meatus. The second stage is contained in the *Aqueduct of Fallopius*, a bony canal lying in the petrous portion of the temporal bone. In this stage it anastomoses with other nerves, and thus *sensory* fibres are introduced into it from the 5th pair and other sources, which make irritation of some of its branches to cause pain. The third stage commences with the emergence of the nerve through the stylo-mastoid foramen. The nerve now lies in the parotid gland (which is not shewn in the figure), and after giving off the *posterior auricular*, and a few smaller branches, finally divides into the *temporal*, *facial*, and *cervical* branches (see 3, 5, and 9 in fig. 2). This diverging distribution of the nervous branches over the face forms the *pes anserinus* of the older anatomists, from the supposed resemblance to the expanded foot of a goose. Careful dissection of this nerve shews that the great majority of its fibres are distributed to muscles; and indeed, if we except the muscles of mastication, which receive their motor power from the 3d division of the 5th

## NERVOUS SYSTEM.

pair, this may be regarded as the general motor nerve of the face. 'The muscles which are supplied by the facial nerve are chiefly those upon which

Fig. 2.—Distribution of the Facial Nerve and of the Branches of the Cervical Plexus :

1, the facial nerve at its emergence from the stylo-mastoid foramen; 3, temporal branches communicating with (4) the frontal branches of the fifth or trifacial nerve; 5, infra-orbital branches, communicating with (6) the infra-orbital branches of the fifth nerve; 7, maxillary branches communicating with (8) the mental branch of the fifth nerve; 9, cervico-facial branches; 15, the spinal accessory nerve giving off a branch to the trapezius muscle.

the aspect of the countenance and the balance of the features depend. The power of closing the eyelids depends upon this nerve, as it alone supplies the orbicularis palpebrarum; and likewise that of frowning, from its influence upon the corrugator supercilii. Anatomy indicates that this nerve is the motor nerve of the superficial muscles of the face and ear, and of the deep-seated muscles within the ear. This conclusion is abundantly confirmed by comparative anatomy. For wherever the superficial muscles of the face are well developed, and the play of the features is active, this nerve is large. In monkeys it is especially so. That extremely mobile instrument, the elephant's trunk, is provided with a large branch of the facial as its motor nerve. In birds, on the other hand, it is very small.—Todd and Bowman, *Physiological Anatomy and Physiology of Man*, vol. ii. p. 107.

Before Sir Charles Bell commenced his experiments on the functions of the nerves, it was believed that the facial was the nerve of sensibility of the face, and it was on several occasions divided with the view of relieving tic douloureux, of which it was supposed to be the seat. But the operation, of course, yielded no relief, and always inflicted a permanent injury, since it was succeeded by paralysis of the facial muscles, with total loss of control over the features and over the closing of the eye, on the side on which the operation was performed.

The treatment of facial palsy which is often, especially if it arises from cold, a very temporary affection, although usually a very alarming one to the patient and his friends, is described in the article PARALYSIS.

The *Hypoglossal Nerve* (derived from the Greek words *hypo*, under, and *glotta*, the tongue) escapes from the cavity of the skull by the anterior condyloid foramen, and passes outwards and forwards around

the pharynx to the interior surface of the tongue where it breaks up into its terminal branches which supply the muscular structure of that organ with motor power. This nerve communicates with the pneumogastric nerve, with the sympathetic (by branches derived from the superior cervical ganglion), and with the cervical plexus, soon after its emergence from the cranium; and subsequently as it curves round the occipital artery (see fig.

Fig. 3.—This figure illustrates the Anatomy of the Neck, and shows, *inter alia*, the Nerves given off to the Tongue :

1, portion of temporal bone, shewing the external acoustic meatus and mastoid and styloid processes; 5, the tongue; 6, the common carotid artery; 14, the internal jugular vein; 15 and 16, the external and internal carotids; 17, the motor branch of the fifth nerve; 20, the glossopharyngeal nerve; 21, the hypoglossal nerve; 22, the descending vena; 23, the pneumogastric nerve, lying between the carotid artery and the jugular vein; 25, the facial nerve.

gives off the long anastomosing branch known as the *Descendens noni*.

Experiments on living animals, comparative anatomy, and pathological investigations, all indicate that this is the motor nerve of the tongue. In cases of paralysis of this nerve, the power of articulation is much injured or totally destroyed; this is often one of the first symptoms which lead the physician to apprehend serious cerebral lesion.

We now proceed to the consideration of the *Compound Nerves*, beginning with the *Trifacial Fifth Nerve*. This nerve, as was first pointed out by Sir Charles Bell, presents a remarkable resemblance to the spinal nerves in its mode of origin, for it arises by two roots, one large and the other small, and on its larger root, as on the posterior larger root of the spinal nerves, is a distinct ganglion; the two roots being quite distinct after the formation of the ganglion, when the smaller one coalesces with the lowest branch, which emerges from the ganglion to form the inferior maxillary nerve. This ganglion, which is known as Gasserian Ganglion, and which is formed upon the larger root of the nerve, lies upon the anterior surface of the petrous portion of the temporal bone, and is of a somewhat triangular form, with its base directed forwards and outwards. From this point there proceed three nerves—viz. the ophthalmic on the inside; the superior maxillary, in the middle; and the inferior maxillary, externally. The two of these nerves consist exclusively of

from the ganglionic root, while the third—the inferior maxillary—is composed of fibres from both roots, and is therefore a compound nerve. From the mode of distribution, as well as from that of origin, it is inferred that the ophthalmic and superior maxillary are purely sensory, while the inferior maxillary is a motor and sensory nerve. (We have not inserted a special figure of this complicated nerve; the frontal branch of the ophthalmic division is, however, shewn in No. 4, fig. 2, while the infra-orbital branches of the superior maxillary division, and the mental branches of the inferior maxillary division, are shewn in Nos. 6 and 8 of the same figure; while the gustatory or lingual branch of the last-named division is shewn in No. 17, fig. 3. The nasal branches also shewn in one of the diagrams illustrating the article NOSE.) Experiments on living animals confirm the inference that have been drawn on anatomical grounds. Division of the ophthalmic or of the superior maxillary nerve, induces loss of sensibility without any serious impairment of muscular power; but when the inferior maxillary nerve, on either side, is divided, the power of mastication is destroyed on that side, and the sensibility of the tongue and of the lower part of the face on that side is lost.

The lingual or gustatory branch of the inferior maxillary is distributed to the mucous membrane and papillae at the fore part and sides of the tongue, where it acts both as a nerve of common sensibility and of taste. (The consideration of the respective parts which this nerve and the glossopharyngeal play in the sense of taste, is considered in the articles TONGUE and SENSE OF TASTE.)

The trifacial nerve is the seat of the affection known as *tic-douloureux*, and described in the article NEURALGIA. It is in the dental branches of this nerve that toothache is situated; and in the process of teething in young children, the irritation of these branches, consequent upon the pressure of the teeth, often gives rise to convulsions, by being conveyed to the medulla oblongata, and exciting motor nerves by reflex action.

The *Glossopharyngeal Nerve* is principally an afferent or sensory nerve, but has a small motor root. It escapes from the cranium in association with the pneumogastric and spinal accessory nerves, through the same foramen as that through which the jugular vein emerges. It then descends by the side of the pharynx, and after anastomosing with the facial and pneumogastric nerves, and giving off a branch to the tympanum of the ear, terminates in branches to the mucous membrane of the base of the tongue, of the palate, tonsils, and pharynx, and in twigs to the digastric and stylopharyngeal muscles; so that its distribution is almost entirely to sentient surfaces (see fig. 3, No. 20). From a careful examination of the investigations of Dr John Reid and others regarding the functions of this nerve, Todd and Bowman arrive at the following conclusions: 1. 'It is the sensitive nerve of the mucous membrane of the fauces and of the root of the tongue, and in the latter situation it ministers to taste and touch, as well to common sensibility; and being the sensitive nerve of the fauces, it is probably concerned in the feeling of nausea, which may be so readily excited by stimulating the mucous membrane of this region.' 2. 'Such are its peripheral organisation and central connections, that stimulation of any part of the mucous membrane in which it ramifies, excites instantly to contraction all the facial muscles supplied by the pneumogastric and the facial nerves; and the permanent irritation of its peripheral ramifications, as in the case of sore throat, will affect other muscles supplied by the facial nerve likewise. It is therefore an excitator of

the movements necessary to pharyngeal deglutition.' —*Op. cit.* vol. ii. p. 119.

The *Pneumogastric Nerve*, or *Par Vagus*, is distributed to so many important organs (the larynx, heart, lungs, stomach, &c.), and is of such great physiological importance, that a special article is devoted to its consideration.

The *Spinal Accessory Nerve* is more remarkable for its peculiar course than in any other respect. It rises from the spinal cord at the level of the fifth or sixth cervical nerve, passes upwards between the anterior and posterior roots of the cervical nerves into the skull, and emerges from the cranial cavity with the two preceding nerves. It is chiefly distributed to the trapezius muscle. See Fig. 2, No. 15.

In the above remarks on the cranial nerves, we have omitted all notice of their points of origin, as that subject is sufficiently noticed in the article BRAIN.

We shall now briefly notice the mode in which the extremities receive their nerves. These nerves are derived from the spinal nerves, through the intervention of what is termed in anatomy a *plexus*. Four or five nerves proceed from the spinal cord for a certain distance, without any communication with each other. They then divide, and from the conjunction of the adjacent branches new nerves result, which again subdivide and interchange fibres. From the net-work or plexus thus formed nerves emerge, each of which is composed of fibres derived from several of the original branches. The most important of these plexuses are found in the regions of the neck, the axilla, the loins, and the sacrum, and are known as the cervical, brachial, lumbar, and sacral plexuses.

The *Brachial Plexus* is formed by communication

Fig. 4.—A diagram shewing the Brachial Plexus of Nerves of the left side, with its branches. Front view.

1, the brachial plexus; 2 and 3, the anterior and posterior thoracic nerves; 4, the phrenic nerves going to the diaphragm; 7 and 9, the external and internal cutaneous nerves; 10, the origin of the median nerve (which receives its name from taking a course along the middle of the forearm to the palm of the hand); 12 and 13, branches of this nerve; 14, the point at which it passes under the annular ligament, and divides into its terminal branches, which are distributed to the thumb and to all the fingers except the little finger and the outside of the ring-finger, which are supplied by (15) the ulnar nerve, whose terminal branches are shewn at 18; 19, the musculospiral nerve (the largest of the plexus); 23, 24, the radial nerve, one of the branches of the musculospiral.

between the anterior roots of the last four cervical nerves and the first dorsal nerve. These nerves are

## NERVOUS SYSTEM.

nearly equal in size, and their mode of distribution is sufficiently explained by the diagram. The branches emerging from this plexus supply the shoulder and the arm; and the names of the most important of these branches are given in the description attached to the figure.

The *Lumbar and Sacral Plexuses*, with the nerves of the lower extremity, are shown in fig. 5. The

Fig. 5.—A diagram showing the Lumbar and Sacral Plexuses, with the Nerves of the lower extremity.

- 1, the first four lumbar nerves which, with the branch from the last dorsal, form the lumbar plexus; 2, the four upper sacral nerves, which, with the last lumbar, form the sacral plexus; 3, the anterior crural or femoral nerve; 4, its terminal branch, the long or internal saphenous; 5, the gluteal nerve; 6, the lesser sciatic nerve; 7, the greater sciatic nerve (the largest nerve in the body), dividing at about the lower third of the thigh, into 8, the popliteal nerve, and 9, the peroneal nerve; 10, muscular branches of the popliteal, given off in the posterior region of the knee; 11, the posterior tibial nerve, dividing, at 12, into the internal and external plantar nerves, which are distributed to the sides of the toes, in precisely the same manner as the median and ulnar nerves are distributed to the fingers; 13, the external saphenous nerve; 14 and 15, the two terminal branches of the peroneal nerve—viz. the anterior tibial and the musculo-cutaneous nerves.

description attached to the diagram sufficiently explains the mode of formation and the distribution of the branches of these plexuses.

The general arrangement of the *sympathetic system*, or, as it is sometimes termed, the *sympathetic nerve*, has been already noticed at the beginning of this article. Its cephalic portion consists of four ganglia on either side—viz., (1) the Ophthalmic, or Lenticular Ganglion; (2) the Spheno-palatine, or Meckel's Ganglion; (3) the Otic, or Arnold's Ganglion; and (4) the Submaxillary Ganglion. They are all closely connected with the branches of the trifacial nerve. The cervical portion contains three ganglia, the dorsal twelve, the lumbar four, the sacral five, and the coccygeal one, which, instead of lying on the side of the vertebral column, is placed in front of the coccyx, and forms a point of convergence for the two ganglionated cords which run from the cervical to the sacral region parallel to one another. Each ganglion may be regarded as a distinct nervous centre, from which branches pass off in various

directions. In addition to the cords of communication between the ganglia, certain sets of nerves may be usually traced—viz. (1) *visceral nerves*, which generally accompany branches of arteries to the viscera (the lungs, heart, kidneys, liver, spleen, and intestine, &c.); (2) *arterial branches*, distributed to arteries in the vicinity of the ganglia; and (3) branches of *communication* with the cerebral and spinal nerves, an example of which is shown in fig. 1.

The distribution of the sympathetic nerve on the right side is shown in fig. 6. The only nerve that our limited space will permit us to notice is the *great splanchnic*. This nerve arises by separate roots from the 5th, 6th, 7th, 8th, and 9th thoracic ganglia. These roots (see the figure) unite to form a large round cord, which passes obliquely downwards and forwards, and after entering the abdomen by piercing the diaphragm, ends in a large and complex ganglion, the *semilunar ganglion*, which lies upon the side and front of the aorta, at the origin of the coeliac artery. The semilunar ganglia, with the nerves entering and emerging from them, combine to form the *solar plexus*, which, from the mass of nervous matter which it contains, has been termed the *abdominal brain*. It is in consequence of the existence of this great nervous centre, that a blow in the region in which it lies always inflicts a severe nervous shock, and not unfrequently causes death.

Experiments and clinical observations lead to the conclusion, that the sympathetic system supplies motor power to many of the internal viscera, especially the heart and the intestinal canal; that it also contains sensitive fibres, as is shown by the sufferings of patients during the passage of a gall-stone or a renal calculus through a duct, whose sole nervous energy is derived from this system; that it presides over the process of secretion in the most important glands; and that it operates on the blood-vessels in causing them to contract, while the cerebro-spinal nerves produce the opposite effect.

On examining different parts of the nervous system under the microscope, we find that the nervous matter is distributed in two forms, the *vesicular* and the *fibrous*. The vesicular matter is gray in colour, and granular in texture, contains nucleated nerve cells, and is largely supplied with blood; it is immediately associated with mental actions, and is the seat in which the force manifested in nervous action originates. The fibrous matter is, in most parts, white and composed of tubular fibres, though in some parts it is gray and consists of solid fibres; it is less vascular than the former, and is simply the conductor of impressions made upon it. When these two kinds of matter are united together into a mass they form a *nervous cord*, such as the brain or spinal cord, while the nerves passing to and from them are composed of threads of fibrous matter. The nervous matter of both kinds is a soft, unctuous substance, with very slight tenacity; the softness being in a great measure due to the large quantity of water which it contains.

The *fibrous* form is the most extensively diffused throughout the body. It forms a large portion of the nervous centres, and is the main constituent of all the nerves. It occurs in two varieties—viz. as the *tubular fibre*, or the *nerve tube*, and the *gelatinous fibre*, the latter being of comparatively rare occurrence, and being found chiefly in the sympathetic system.

When a *tubular fibre* is viewed by reflected light it presents a beautiful pearly lustre, and appears to be homogeneous. But if viewed by transmitted light, with a sufficient magnifying power, indications of structure become visible. Externally, there is the

# NERVOUS SYSTEM.

tubular membrane (A d, d, fig. 7), a homogeneous and probably very delicate elastic tissue, according to Todd. Within the edge of the tubular membrane, on

- m, the bladder;
- n, the lower portion of the rectum.

either side are seen two thicker and darker lines (A c, c, b), which appear to mark the outer and inner limits of the structure known as the *white substance of Schwann*, which forms a tube within the tubular membrane; and within the white substance of Schwann is a transparent material occupying the axis of the nerve tube, and commonly known as the *axis cylinder* (A a). By the application of reagents, it is seen that the chemical composition of the white substance is different from that of the axis cylinder, and hence the functions of these two parts are doubtless different; the latter is in general soft and pulpy. The nerve-tubes are cylindrical in form, and lie parallel to one another, without any inosculation, if we except their frequent terminations in loops. Their average diameter is about  $\frac{1}{1000}$  of an inch.

The *gelatinous fibres* are flattened, soft, and homogeneous in appearance, and contain numerous round or oval nuclei (see fig. 7, C). Their diameter is about  $\frac{1}{1000}$  of an inch. In appearance they much resemble the fibres of unstriated muscle.

The *vesicular form* of nervous matter is of a dark reddish-gray colour, is found only in the nervous centres, is always well supplied with capillaries, and consists essentially of nucleated cells or vesicles, which are most commonly globular or ovoidal, but often present one or more tail-like processes, when they are termed *caudate* (see fig. 8). These caudate vesicles present great difference in shape and size. The processes are very delicate, and readily break off close to the vesicle. They probably either serve to connect distant vesicles, or else become continuous with the axis cylinders of the tubular fibres.

We may now consider the way in which the nerves and nervous centres are made up of these anatomical elements.

Fig. 7.

A, diagram of tubular fibre of a spinal nerve; a, axis cylinder; b, inner border of white substance; c, c, its outer border; d, d, tubular membrane; B, tubular fibres; e, in a natural state, shewing the parts as in A; f, the white substance and axis cylinder interrupted by pressure, while the tubular membrane remains; g, the same, with varicosities which are especially apt to be exhibited in the nerves of the special senses, and of young animals generally; C, gelatinous fibres from the solar plexus, treated with acetic acid to exhibit their cell-nuclei; B and C magnified 320 diameters; A on a considerably larger scale.

—From Todd and Bowman.

A nerve is composed of a bundle of tubular fibres surrounded and connected by areolar tissue, which forms a sheath known as the *neurolemma*, whose

office is to protect the delicate tubes, and to support the capillaries from which they derive their nourishment.

The *nervous centres* exhibit a union of the vesicular and fibrous textures, which may be variously arranged. In the Brain (q. v.) the vesicular matter lies externally, forming the gray or cineritious substance; in the spinal cord, on the other hand, the vesicular or gray matter lies in the central portion,

Fig. 9.—A small piece of the Otic Ganglion of the Sheep, slightly compressed, shewing the interlacement of the nervous fibres and vesicular matter.

and the fibrous or white matter is external to it; while in the ganglia the two structures are more or less uniformly associated (see fig. 9).

From the observations which have been made in an earlier part of this article on the functions of individual nerves, it is sufficiently obvious that it is through the instrumentality of the nervous system that the mind influences the bodily organs, as when volition or emotion excites them to action; and that, conversely, impressions made on the organs of the body affect the mind, and excite mental perceptions through the same channel. 'In this way,' to quote the words of Dr Todd, 'the nervous system becomes

the main agent of what has been called the relation; for without some channel of communication of the mandates of the will to motion, or some provision for the reception of impressions which external objects excite, the mind, thus completely isolated, holds no communion with the external nature of the connection between the nervous matter is, and must ever remain a mystery in physiology, and one which human intellect can never hope to solve. There are, however, many actions of the mind the production of which the mind has no part in; these are the nervous actions, which, with the functions of organic life, such as nutrition, respiration, and circulation, form another class of actions for which (an afferent or excitator, and a motor centre) are necessary. These are the actions as *reflex* or *excito-motory*, for the functions of which physiology is especially indebted to the labours of the late Dr Marshall Hall. Thus, the movement of the oesophagus in swallowing food onwards to the stomach, is excited by a stimulus of the food acting on the afferent nerves, which, through the medium of the motor or efferent nerves, rise to the necessary muscular action. If the edge of the eyelid is touched, the motor branch of the ophthalmic division of the trifacial nerve conveys the impression of stimulus to the nervous centre, and once closed by the motor influence, the eye is shut. In such cases as these—amongst a very numerous class—the mind takes no part; some of them it is conscious of the stimulus, as well as of the muscular action which follows; but even in these cases the mind will could modify or interrupt the phenomena.

It has been already shewn that the action of nerves is common to two kinds, mental and physical, and that which these stimuli produce in a system is the power known to physiologists as nervous force. The nervous force, as Mr Sharpey, in his *Address on Physiology*, 'has long been likened to electricity through a vague perception of analogy, without any rigorous comparison. It is true that force is developed in the nerves, and modifications connected with different nervous action. Still, it must be remembered that the evolution of electricity is a companion of various processes involving change, whether within the living system or external nature; and the tendency of electricity is not towards the identification of force with electricity, but rather that the two stand related in the same way, and other physical forces are related to it—that is, as manifestations of a common energy, of which they, severally, are the manifestations.' The velocity with which the nervous force is transmitted by the nerves has been the subject of investigation, but it is far from the observations are to be dependent on the sequence of the various sources of false such experiments are beset. According to the velocity is 34 metres, or about 100 feet per second in man; while Helmholtz fixes it at 27 metres per second in the frog.

The description of the nervous system given in the foregoing pages is applicable, with slight modifications, to all the Vertebrates; the same

being in the degree of the development of the brain—a point which has been already noticed at the commencement of the article BRAIN. For a sufficient notice of the plan of the nervous system in the Invertebrate animals, the reader is referred to the articles ARTICULATED ANIMALS, MOLLUSCA, and RADIATA. It is only in the lowest subdivision of the Animal Kingdom, the PROTOZOA, that no traces of a nervous system can be detected.

For further information on the subject of this article, the reader is referred to Dr Carpenter's works on *Human and Comparative Physiology*, to Dr Todd's article on 'The Nervous System' in *The Cyclopædia of Anatomy and Physiology*, to Todd and Bowman's *Physiological Anatomy and Physiology of Man*, and to Funke's *Lehrbuch der Physiologie*.

NESS (identical with Eng. *nose*, A.-S. *næse*, Ger. *nase*, Ice. *nes*, Lat. *nasus*, Fr. *nez*), a geographical termination, signifying promontory. Names in -ness abound among the Orkney and Shetland Islands, and on the coast of Caithness; and they occur, though less frequently, along the east coast of Great Britain, as far as Dungeness in Kent. As the corresponding Scandinavian termination -*naes* prevails in the names of promontories in Norway, Sweden, and Denmark (e. g., Lindesnaes, in south of Norway), the existence of names in -ness in Britain is held as an evidence of Scandinavian and Danish colonisation. Grisev, on the north coast of France, points to the same source.

NESS, LOCH, a long narrow lake in Inverness-shire, Scotland, extends north-east and south-west, and is 23 miles in length, and 1½ mile in average breadth. Its north-east extremity reaches a point 6 miles south-west of the town of Inverness. It receives the Morriston, the Oich, the Foyers, and other streams, and its surplus waters are carried off to the Moray Firth by the River Ness. It lies in the valley of Glenmore, and is enclosed by mountain masses averaging 1000 feet in height; but the scenery on its banks is not strikingly picturesque. In many places it is about 130 fathoms in depth, and owing to the length of time which this immense body of water takes to cool down to the freezing-point, ice never forms to any considerable extent.

NESSELRODE, KARL ROB., COUNT, one of the most eminent diplomatists of modern times, was born, 14th December 1780, at Lisbon, where his father, a descendant of an ancient noble family on the Lower Rhine, was then Russian ambassador. He early devoted himself to a diplomatic career, gained in a high degree the esteem and confidence of the Emperor Alexander, and in 1813 was one of the representatives of Russia in the important negotiations which took place between the powers who combined against France. In 1814, he accompanied the Russian emperor to France, and on 1st March signed the treaty of the Quadruple Alliance at Chaumont. He was also one of those who concluded the treaty with Marshal Marmont for the surrender of Paris. He continued to take a principal part in all the negotiations which ended in the Peace of Paris; and was one of the most prominent and active of the plenipotentiaries in the Congress of Vienna. He was one of the most active diplomatists of the Holy Alliance, and accompanied the Emperor Alexander to the Congresses of Aix-la-Chapelle, Troppau, Laibach, and Verona. The Emperor Nicholas reposed in him the same confidence, and under his reign he conducted the Russian policy in the affairs of Greece and Turkey. Amidst the European convulsions of 1848 and 1849, Russia, under his guidance, refrained from interference, till opportunity occurred of dealing a deadly blow to the revolutionary cause in Hungary; and,

at the same time, of bringing Austria very much under Russian influence. Being one of the chiefs of the German or moderate party in Russia, N. is supposed to have exerted himself strenuously to preserve peace with the Western Powers; and after the war had broken out in 1854, and the ill success of Russia was manifest, he undoubtedly strove for the re-establishment of peace, and for the assembling of a congress to settle all disputes. After the accession of Alexander II. he retired from the direction of foreign affairs, and was succeeded in that department by Prince Alexander Gortchakov, but retained the dignity of chancellor of the empire, and a seat in the ministerial council. He died at St Petersburg, 23d March 1862.

NESTOR, according to ancient Grecian legend, the son of Neleus and Chloris, born in the Messenian Pylos, escaped destruction when Hercules slew all his brothers, being then a dweller among the Geronians, with whom he was brought up. He married Eurydice, by whom he became the father of a numerous family. In his youth he was distinguished for valour in wars with the Arcadians, Eleians, and the Centaurs, and in his advanced age for wisdom. Although he was an old man when the expedition against Troy was undertaken, he joined it with his Pylions in sixty ships. Homer makes him the great counsellor of the Grecian chiefs, and extols his eloquence as superior even to that of Ulysses. His authority was even considered equal to that of the immortal gods. N. returned in safety to his own dominions after the fall of Troy, along with Menelaus and Diomedes, and continued for long to rule over the people of Pylos.

NESTORIANS, a sect of the 5th c., so called from its founder NESTORIUS, under which head their distinctive doctrine, as well as their history up to the time of its condemnation, are sufficiently detailed. Of the later history it will be enough to say that, even after the Council of Ephesus, Nestorianism prevailed in Assyria and Persia, chiefly through the influence of the well-known school of Edessa. Although vigorously repressed in the Roman empire, it was protected, and probably the more on that account, by the Persians, and ultimately was established by King Pherozes as the national church, with a patriarch resident at Seleucia; its fundamental doctrine, as laid down in the synod of Seleucia in 496, being the existence of two distinct persons as Christ, united solely by a unity of will and affection. Under the rule of the califs, the N. enjoyed considerable protection, and throughout the countries of the East their community extended itself. Of their condition in Central Asia during the mediæval period, some account will be found under the head of PRESTER JOHN. In the middle of the 12th c., their church reckoned no fewer than 90 bishops under regular metropolitans, together with 56 others, whose special dependencies are unknown; but in the destructive career of Tamerlane, they shared the common fate of all the representatives of the eastern civilisation. In the 16th c., a great schism took place in this body, of which a portion renounced their distinctive doctrine, and placed themselves under the jurisdiction of the Roman pontiff, to whom, under the title of Chaldean Christians, they have since remained faithful. The others still maintain their old creed and their ancient organisation. Their chief seat is in the mountain-ranges of Kurdistan. They are at present a poor and illiterate race, numbering about 140,000, and subject to a patriarch residing at Diz (who is always chosen from the same family, and takes invariably the name of Schamun, or Simon) and 18 bishops. All these are bound to observe

celibacy, but marriage is permitted to the priests and inferior clergy. Their liturgical books recognise seven sacraments, but confession is infrequent, if not altogether disused. Marriage is dissoluble by the sentence of the patriarch; communion is administered in both kinds; and although the language of the liturgy plainly implies the belief of transubstantiation, yet, according to Layard, that doctrine is not popularly held among them. The fasts are strict, and of very long duration, amounting to very nearly one half of the entire year. They pray for the dead, but are said to reject the notion of purgatory, and the only sacred image which they use or reverence is that of the cross. The N. of Kurdistan, like the Christians of the Lebanon, have suffered much from time to time through the fanaticism of the wild tribes among whom they reside. In a massacre in 1843, and again in 1846, many fell victims, and even still they owe much of their security to the influence exercised in their favour by the foreign representatives at the Turkish and Persian courts.

There is another body of N. who have existed in India from the period of the early migrations of the sect, and who are called by the name of Syrian Christians. Their chief seat is in Travancore, where they number about 100,000, and are subject to a patriarch. Among both bodies of N., European missionaries, Catholic and Protestant, have of late years endeavoured to effect an entrance, but the details would be out of place here. See *A Residence of Eight Years in Persia, among the Nestorian Christians*, by Rev. Justin Perkins, Andover, 1843.

NESTORIUS, a native of Germanicia, a city of Northern Syria, in the patriarchate of Antioch, was probably a disciple of the celebrated Theodore of Mopsuestia; and having received priest's orders at Antioch, became so eminent for his fluency, if not eloquence, as a preacher, and for grave demeanour and exemplary life, that on occasion of a dispute about the election of a patriarch of Constantinople he was selected by the emperor, in 428 A.D., to fill the vacant see. Soon after his consecration, a controversy arose as to the divine and human natures of our Lord, in which N. took a leading part. One of the priests, who followed N. to Constantinople, Anastasius, having in a sermon, which was by some ascribed to N. himself, denied that the Virgin Mary could be truly called the 'Mother of God,' being only in truth the mother of the man Christ, N. warmly defended Anastasius, espoused this view, and elaborated it into the theory which has since been known by his name, and which equivalently, if not in formal terms, exaggerated the distinction of two natures in our Lord into a distinction of two persons—the human person of Christ and the Divine Person of the Word. An animated controversy ensued, which extended from Constantinople to the other patriarchates, and drew from Cyril, patriarch of Alexandria, a formal condemnation of the doctrine of N. in twelve anathemas still preserved, and a similar condemnation, accompanied by a threat of deposition and excommunication, from Celestine, bishop of Rome, unless he would withdraw the obnoxious doctrine. N. remaining firm in his opinions, a general council was convened at Ephesus in 431, at which Cyril took the most active and prominent part, and in which, notwithstanding the absence of the patriarch of Antioch and his bishops, N. was condemned and deposed. Considerable opposition was offered to this judgment for a time, but ultimately N. was confined in a monastery near Constantinople, whence, after four years, still persisting in his views, he was banished to the Greater Oasis in Upper Egypt, and after several changes of his place of confinement, died in exile. The

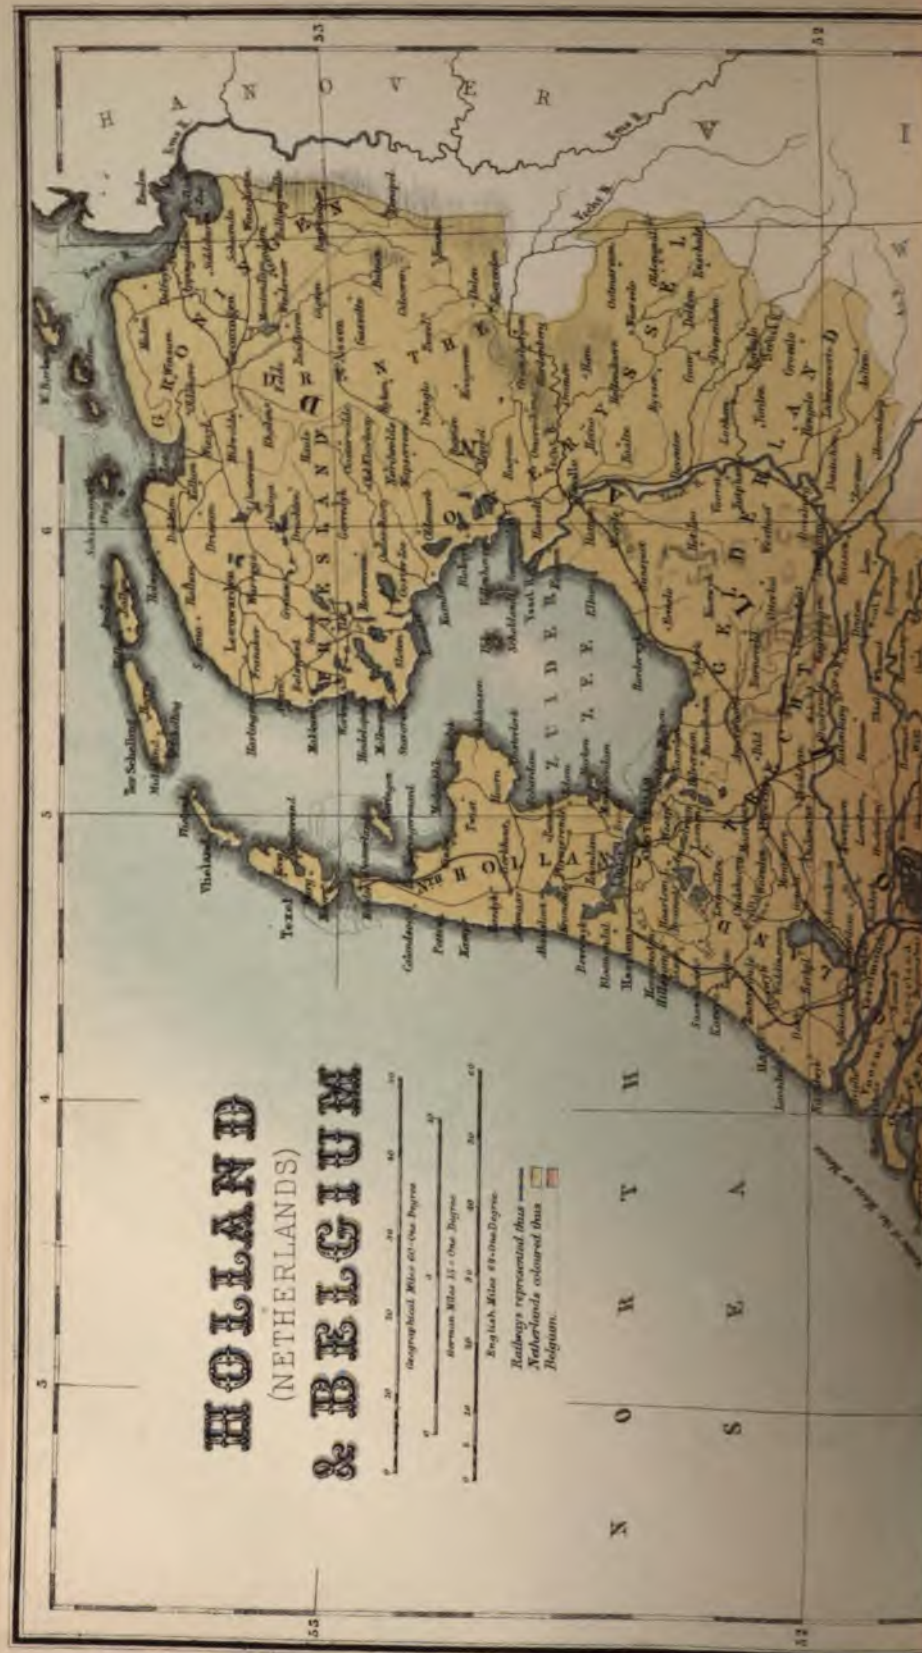

account given by Evagrius, that his death was caused by a disease in which his tongue was consumed by worms, rests, according to Evagrius, on a single and unnamed authority. The narratives ascribe his death to the effect of the plague. The date of this event is uncertain. It is placed by Socrates in 450, when Socrates wrote his history (vii. 34), but there is little doubt that he died in 450, when the Eutychian controversy began to attract notice.

NESTS (Lat. *nidus*, Gael. *nead*; all. *nähen*, Sax. *nestan*, Lat. *nectere*, to sew, tie) are the structures which animals construct for the rearing of their young. They are not only made by the creatures which construct them, but belong to widely separated divisions of the animal kingdom, but often when the animals of the same class, or even when they are not of the same class, and whilst some construct very simple nests, those of others are very curious and elaborately framed, some make no nest at all. AMIMALS, the only nest-builders are certain birds, mice, dormice, squirrels, &c. The nests of some of the species are as artfully constructed as the nests of birds. It is a general rule that nest-making is most general; although there are not a few species which merely scratch a hole in the ground, and many sea-fowls lay their eggs on ledges of naked rock. The situations chosen for their nests are very various, each species exhibiting some particular kind of situation, as also exhibits a uniformity in choice of material, and in form and mode of structure; and, in some cases, the nests are peculiar, however, being all liable to modification within certain limits—according to circumstances. Some birds' nests consist merely of a few leaves collected together; some, of such materials as twigs, straws, moss, hair, &c., very elaborately woven, and often with a lining finer than the outer work; some, as those of swallows, are made of mud or other soft material, which hardens. Birds' nests are generally open at top, but those of swallows, are so placed under the eaves of a building, as to be covered by the opening at the side; whilst others are open at the side, and have the opening at the side. Some are in holes excavated in clayey, loamy, or sandy earth. The nests of troupials, baltimores, &c., are remarkable for the ingenious display in them; and a very singular example is the nest of the tailor-bird, made by sewing the edges of leaves. These are noticed in the habits of many birds. Many birds are as industrious in their nidification; whilst some, as the rooks and herons, congregate in large colonies. —No REPTILES are known to construct nests. —The utmost approach to it being to make their eggs in sand, or in some other suitable material. —The nests of FISHES have recently attracted much attention of naturalists. It is supposed that the ancients were acquainted with the nidification of some fishes; but it was not until modern naturalists till 1838, when Mr. Stickleback discovered it in a species of Stickleback, that it now gives interest to many a fresh-water fish. Not many fishes are yet known as nest-builders. Among them are gobies and the goral. The goral are known not to construct nests. The others exhibit an approach to the nidification, in making a place for their eggs in sand, or gravel which they choose for a spawning place. —Many INSECTS—a small proportion, however, of the whole number, and mostly *Hymenoptera*—construct nests, as bees, wasps, and ants. The social bees and wasps are also their nidifications, but the nests of solitary bees are

Printed in colors by

W & R CHAMBERS, LONDON & EDINBURGH

J. Bartholomew Edinburgh

# NESTS—NETHERLANDS.

voted to their young. A few insects, not hymenopterous, as some weevils, may also be said to make nests; but among insects provision for the wants of the young is usually made in very different ways. Certain spiders, amongst which may be named the water-spider, construct nests.—The instinct of nest-making, connected as it is with the instinctive care for their young which the Creator has made so important a part of the nature of so many animals, by no means an index either of that care or of the affection with which, in many cases, it is combined; and some of the animals which construct nests are among those in which affection for their young is exhibited in the highest degree.—The nest-making instincts of animals seem to be a very essential part of their constitution; and even in the most perfect domestication are still retained and exhibited; although the accommodation to circumstances which is also manifested shews something—and that not inconsiderable—of reason.

**NESTS, EDIBLE**, an important article of commerce between the Eastern Islands and China. One of luxury in China, are the nests of several species of Swallow (q. v.), of the genus *Collocalia*. The best known of these birds, *C. esculenta*, is about 10 inches in length, 11 inches in expanse of wing, dusky black above, pale ash-colour beneath. The nest is shaped like that of the common swallow, and adheres to a rock; vast numbers being found together—often in absolute contiguity—in caves of the Eastern Archipelago; as those of the same allied species are in other islands of the East Indies. The nests are formed of a gelatinous substance—the finest being transparent, or nearly so with a somewhat fibrous structure, and are now believed to be made of sea-weeds of the genus *Didium* (q. v.). The nests are collected by means of ladders, and often by means of ropes, which

Chinese Swallow and Nest.

enable the gatherers to descend from the summit of a precipice, like the rock-fowls of the North. The gathering of the nests takes place after the young are fledged. In the Chinese market the nests are sold for prices varying according to the quality, from £2 to £7 per pound, and they are of course used only by the most wealthy, chiefly for thickening rich soups. They are very wholesome and nourishing, but quite devoid of the peculiar properties which the Chinese ascribe to them.—The Dutch used to export from Batavia about 1000 peckuls of these nests annually, a peckul being about 25 pounds, and worth from 1000 to 1500 dollars. The greater part, however, were bought from more eastern islands. The nests weigh about half an ounce each.

**NETHERLANDS, THE KINGDOM OF**, lies between 50° 43' and 53° 36' N. lat., and 3° 22'

and 7° 16' E. long., is bounded on the N. by the North Sea, E. by Hanover and the western part of Prussia, S. by Liège, Belgian Limburg, Antwerp, East and West Flanders, W. by the North Sea. Its greatest length from north to south is 195 English miles, and its greatest breadth from the west, on the North Sea, to the extremity of Overijssel, on the east, 110 English miles. It contains 12,597 square miles. Pop., including the grand duchy of Luxembourg, 3,835,111. The following table gives the population, 1st January 1872, the area of the provinces, including the reclaimed Haarlem Lake, and the provincial capitals:

Provinces.	Area in Sq. Miles.	Pop. 1872.	Provincial Capitals.
North Brabant,	1960	435,262	's Hertogenbosch.
Gelderland,	1948	436,029	Arnhem.
South Holland,	1162	700,499	The Hague.
North Holland,	1050	591,338	Haarlem.
Zeeland,	665	181,532	Middelburg.
Utrecht,	532	175,037	Utrecht.
Friesland,	1253	300,257	Leeuwarden.
Overijssel,	1274	256,681	Zwolle.
Groningen,	898	228,883	Groningen.
Drenthe,	1017	106,713	Assen.
Limburg,	840	225,352	Maastricht.
Grand Duchy of } Luxemburg, }	12,597 987	3,637,583 197,528	Luxemburg.
Total,	13,584	3,835,111	

The population averages 282 to the square mile, but in Drenthe falls as low as 105, and in South and North Holland rises to 603 and 563; Utrecht, Limburg, and Zeeland being the next densely peopled. In 1871, the births amounted to 123,305, of which 4599 were illegitimate. The average was 1 to 27.90. In N. Brabant, 1 to 44.38; Gelderland, 1 to 30.04; South Holland, 1 to 22.73; North Holland, 1 to 24.23; Zeeland, 1 to 26.30; Utrecht, 1 to 21.43; Friesland, 1 to 36.24; Overijssel, 1 to 45.07; Groningen, 1 to 22.54; Drenthe, 1 to 32.03; Limburg, 1 to 37.44.

The leading places are Amsterdam, Rotterdam, Dordrecht, Alkmaar, Middelburg, Schiedam, Leyden, Delft, Gouda, Utrecht, Amersfort, Groningen, Meppel, Zwolle, Kampen, Deventer, Arnhem, Nymegen, Tiel, Gorinchem, 's Hertogenbosch, Tilburg, and Breda.

**Physical Aspect.**—The land is generally low, much of it being under the level of the sea, rivers, and canals, especially in North and South Holland, Zeeland, the southern part of Gelderland, and Friesland. Along the west coast, the low lands are protected from the sea by a line of sand-hills or dunes; and where that natural defence is wanting, strong dykes have been constructed, and are maintained at great expense, to keep back the waters. The greatest of these dykes are those of the Helder and of West Kapelle, on the east coast of Walcheren (q. v.), which require, each, upwards of £6000 annually to keep them in order. Engineers, called the officers of the Waterstaat, take special charge of the dykes and national hydraulic works, the expense of which is reckoned at about half a million sterling. A hilly district stretches from Prussia through Drenthe, Overijssel, the Veluwe or Arnhem district of Gelderland, the eastern part of Utrecht, into the Betuwe or country between the Maas and the Waal. This tract of country has many pretty spots, is of a light sandy soil, well watered, and when not cultivated, is covered with heath or oak-coppice. The greatest part of the N. is very fertile, the low lands and drained lakes, called Polders (q. v.), being adapted for pasturing cattle, and the light soils for cereals and fruits; but in some

## NETHERLANDS.

societies pay a yearly subscription and a small fee for each pupil sent by them to the school, a select number acting as managers. There are national normal schools at 's Hertogenbosch, Haarlem, and Groningen, the pupil-teachers boarding themselves, and receiving, at 's Hertogenbosch, £21 a year, and at Haarlem, £24. The attendance at school is about 1 to 8 of the population in winter, and 1 to 10 in summer. In January 1870, there were in the N., 249,926 boys and 216,853 girls attending public and private elementary schools, with 8735 male and 1998 female teachers.

*Army, Navy, &c.*—The strength of the army, in time of peace, should be 60,000 men, but there is a deficiency of 10,000, even on paper. It is composed of volunteers, and of one man for every 500, drawn by lot for five years' service. There is also a local force, called the Schutterij, drawn by lot from those between 25 and 34 years of age, to assist in keeping order in peace, and in case of war, to act as a mobile corps, and do garrison duty. If attacked on the land-side, 90,000 men are required for the defences, and if by land and sea, 100,000. The first, or Maas line of defence, is formed by Maastricht, Venlo, Grave, 's Hertogenbosch, Woerdrecht, Geertruidenberg, Willemstad, Breda, and Bergen-op-Zoom. The second line is formed by Nymegen, Forts St Andries and Loevestein and Gorinchem. The inner line of Utrecht is formed by various forts from Naarden, Utrecht to Gorinchem, which, by inundations, can make the provinces of North and South Holland into an island. There are many other forts, batteries, and strengths at the mouths of the rivers and along the leading ways, and a new line of defence has (1874) been decided on.

The royal navy consists of 3 steam-frigates, 2 steam-corvettes, 38 screw steam-ships, 13 paddle do., 5 floating-batteries, 2 ships of the line, 7 frigates, 6 corvettes, 11 smaller vessels, 1 transport ship, 13 used for defences, and 35 gun-boats. There is also (1863) an armour-plated steam gun-boat building. The effective strength is 6291 men and 1850 guns. Prince Frederic, uncle of the king, is admiral, the Prince of Orange vice-admiral, and his majesty is commander-in-chief of the land and naval forces.

*Revenue, Expenditure, &c.*—The revenue of 1872 amounted to £8,769,750, and the expenditure to £9,102,583. The budget for 1873 was—revenue, £7,614,492; and expenditure, £9,147,606. Among items of revenue were—direct taxes, £1,820,815; excise, £2,361,666; indirect taxes, £1,247,405; import and export dues, £421,822. Among items of expenditure, £1,100,984 for public works, and £162,813 for education, and £2,291,094 as interest of the national debt. The India revenue for 1872 amounted to £10,104,858, and the expenditure to £9,013,724. The East India colonies, which were a burden in the earlier years of the kingdom, have long been a source of profit.

From 1850 to and with 1873, there has been paid off £24,230,101 from the national debt, lessening the annual interest by the sum of £748,525. The interest now payable on the debt amounts to £2,254,513. The material prosperity of the N. is rapidly increasing, and a sum of probably not less than 300 million pounds is invested by N. capitalists in the funds of other nations.

The chief colonies are Java, Sumatra, Borneo, Celebes, the Spice Islands, and Papua or New Guinea, in the East; and Surinam, Curaçao, and its dependencies, in the West Indies, with factories on the coast of Guinea. Colonial pop. about 18 millions.

*Government, Franchise, &c.*—The government of the N. is a limited constitutional monarchy, heredi-

tary in the male line, and by default of that in female. The crown-prince bears the title of Prince of Orange, and attains his majority at 18, when takes his seat in the council of state. The executive is vested in the king, with a council of state composed of twelve members, nominated by his majesty, and the ministers of the Interior, Foreign Affairs, Finance, War, the Colonies, Marine, and Justice, the last-named taking charge of ecclesiastical affairs through two administrators, or secretaries of state, for the Protestant and Roman Catholic Churches. The legislative power is shared by the king and the two chambers of the States general; the first chamber having 39 members elected for nine years, by the provincial states, a third of their number retiring every three years. The second chamber is composed of 80 members chosen by 105,452 electors above 23 years of age who pay from £1, 14s. to £13, 12s. of direct tax according to the size and importance of the electoral district. These are elected for four years, one-third of the chamber retiring every two years. For members of the town-councils, the electoral qualification is half the above sum. The members of both chambers must be 30 years of age before the day of election, and those eligible for the first chamber, the nobility. This exceedingly high franchise, which, in Amsterdam, is a higher direct tax than the rental qualification of Great Britain, makes election a thing of no interest except to a few. In 1871, only 36.2 per cent. of the electors of North Holland gave their votes, and the maximum in a place was 66.9 per cent. in Limburg, 62.5 in North Brabant, the average being 48.6.

The king nominates the governors of provinces, the burgemeesters of every city, town, or village, and a host of other officials. The cities, towns, and rural parishes are governed by a council, burgemeester (mayor or provost), and wethouders (aldermen or bailiffs). The council consists of from 7 to 39 members, according to the population, who are chosen for six years, one-third part retiring every two years. The council selects out of their number from 2 to 4 wethouders for six years, one-third retiring every third year. These with the burgemeester, form the local executive. The law departments are the High Council, the provincial courts of justice, those of the arrondissements and courts of appeal in many cases being open from the lower to the higher courts.

*History.*—Nothing is known regarding the origin of the inhabitants of the N.; but about a century and half before our era, the people known as the Batavi came out of Hesse, where they were living in hostility with their neighbours, and settled down between the Rhine and the Waal. At this time the Frisians occupied the country north of the Rhine to the Elbe. The Batavi and Frisians differed little in appearance, manner of life, and religion. They clothed themselves with skins, fed by fishing, hunting, and pasturing cattle, ponies, horses, cows, and sheep; were faithful, open-hearted, chaste, and hospitable. The songs of the Batavi composed their literature and history. Warlike and brave, they selected their leader for his courage and prowess, were armed with the bow and a short spear. They worshipped the sun and moon, and held their meetings in consecrated woods.

The Romans having subdued the Belgae, attacked the Frisians, who agreed to pay a tribute of ox-hides and horns, but continued restless and rebellious. The Batavi became allies of the Romans, paying no tribute, but supplying a volunteer contingent, chiefly of cavalry, which decided the battle of Pharsalia in favour of Caesar, and formed a gallant band of the Roman armies in all parts of the

## NETHERLANDS.

ering of lead and copper, cannon-founding are on at the Hague, &c.; and powder-mills at n; Oudenkerk, Middelburg, 's Hertogenbosch, rdam, Nymegen, &c., have important breweries, of 's Hertogenbosch and Amsterdam manufac- very large quantities. Waalwyk, Heusden, rrounding districts, manufacture boots and of which Heusden sends to North and South d 1,000,000 pairs yearly. Gin is distilled at am, Delft, Rotterdam, and Weesp. Amster- as the largest diamond-cutting trade in the 10,000 persons depending on that branch of ry. Sugar-refining is largely carried on at rdam, Rotterdam, and Dordrecht, from all of sugar is exported to Russia, the Levant, and ies of Europe. Paper is chiefly made in Hol- and Gelderland. The leading letter-type rs are at Amsterdam and Haarlem. Manu- as of every kind are being rapidly increased in r, and adding to the material prosperity of etherlands. The chief motive power is the ill, which forms a never-failing element in the y; but of late years, steam is becoming more l. In 1854, the steam-engines employed in ies were 464, with 7980 horse-power; and in 1857, they amounted to 662, of 11,139 horse-power, and the increase has since been going on.

Many people are employed in the immense inland shipping-trade which the canal network has fostered, there being, when the previous census was taken, 6684 ships inhabited by families, or one inhabited ship to 81 houses. The houses were 542,295; families, 668,911. Fishing, not only in the inland waters, the coasts, and bays of the North Sea, but also on the coast of Scotland, is vigorously pursued. In 1872 the total value of the herrings taken in the North Sea was £92,748, 108 vessels having been employed; on the N. coasts, to the value of £52,688; and in the Zuider Zee, additional, were taken 18,052,200 herrings. The anchovy take, almost exclusively in the Zuider Zee, amounted to 9000 ankers, valued at about £18,750. There are pro- ductive oyster beds, besides extensive fishings of cod, ling, turbot, flounders, soles, shrimps, haddock, &c.; and from the rivers, salmon, eels, perch, &c.

*Exports, Imports, Shipping, &c.*—The N. is pecu- liarly a mercantile as well as agricultural country; its merchants not only importing and exporting the products of their colonies and the surplus of their own country, but also those of other lands. The general imports (1871) amounted to a value of £65,456,666, of which from Great Britain were £20,586,333; the exports to £54,123,080, of which £13,462,666 were to Great Britain. The leading exports in 1871 were: cheese, butter, refined sugar, flax, cattle, sheep, pigs, gin, garancine, &c.; the imports, manufactured goods, unrefined sugar, coffee, grain, iron, yarns, cotton, rice, gold, silver, tin, tea, indigo, silk and woollen fabrics. The trade with Great Britain is large and varied, and carried on chiefly by steam-vessels.

In 1870, the laden ships, which cleared in-bound, amounted to 7949, having a tonnage of 2,223,000; those in ballast being 507 ships of 92,000 tons. Of the in-bound ships, the British amounted to 1,102,967 tons. Cleared out-bound, laden, 4632 ships of 1,408,000 tonnage; in ballast, 3654 of 941,000 tons burden. The trade along the rivers, by Belgian and German ships, is large. In 1872, the goods passing up the Rhine amounted to 8,487,966 tons, and from Germany down, 16,492,241. This trade consists largely of grain, timber, and coal. Wheat carried up, 572,250 tons, and rye, 542,112 tons; down, 63,284 tons of wheat and 4702 of rye. Timber, upwards of 498,474 tons; downwards, 806,156 tons, and coal, 881,554.

*Religion, Language, Education, &c.*—About one-third of the population belong to the Roman Catholic Church; 67,000 are Jews, and the remainder Protestants, of whom 2,000,000 are Dutch Reformed. There are (1873) 1495 Dutch Reformed clergymen and 1612 Roman Catholic. For the Reformed religion, stands on the budget for 1873 the sum of £118,999; for the Roman Catholic Church, £49,012; and the Jews, £2967.

There are five dialects spoken respectively in Groningen, Friesland, Gelderland, Holland, and Zeeland. These differ considerably from each other, and the Frisian is not at all understood by natives of the other provinces. The written language is the Dutch, that branch of the great Teutonic stock which preserves more of its original character than the rest of the same family. It possesses numerous words the same as Lowland Scotch, and bears a strong affinity to the Old Saxon English, as the following Dutch proverb shews:

Als de wyn is in den man,  
Is de wysheid in de kan.

The kingdom of the N. has produced many great names in all branches of literature and science. Coster (q. v.), according to his countrymen, invented printing, Leeuwenhoek the microscope, and Huygens applied the pendulum. Out of a long list of distinguished names, may be mentioned those of Erasmus, Scaliger, Heinsius, Hugo de Groot (Grotius), Huygens, Leeuwenhoek, Vitringa, Boerhave, and the poets Hooft, Vondel, and Cats; whilst the writings of Van der Palm, Van Lennep, Des Amorie van der Hoeven, Haafner, Stuart, Van Kampen, and those of the poets Bilderdijk, Da Costa, De Bull, Van den Berg, ter Haar, and Hofdyk, shew that literature is not waning. Exclu- sive of newspapers, there are 226 magazines and periodicals published in the N., of which 67 are religious, 42 on art, belles-lettres, and general litera- ture, and 7 on antiquity, history, &c. Leading painters of the old Dutch school were Rembrandt, Gerrit (Gerard) Dou, Gabriel Metzu, Jan Steen, Paul Potter, Ruysdaal, Van der Helst; and among those of the present century, Ary Scheffer, Koekkoek, Schelfhout, Pieneman, Kruseman, Van Os, Craeyvanger, ten Kate, Israels, Bles, Louis Meyer, Roeloff, Springer, &c., have distinguished themselves.

There are universities at Leyden, Utrecht, and Groningen; *atheneums* or colleges at Amsterdam, Deventer, and Maastricht, the students attending which must be examined for degrees at one of the universities. Latin schools are in all the leading towns. The universities and *atheneums* have facul- ties of theology, medicine, philosophy, law, and letters. There are also the Royal Military and Naval Academy at Breda, and that for engineers and the India civil service at Delft; seminaries in several places for the training of the Roman Catholic clergy; and others, especially in Amsterdam, for those of the smaller Protestant sects; and many literary, scientific, and agricultural institutes.

Each community or parish must have, at least, one elementary school, supported from the local public funds, in which reading, writing, arithmetic, history, geography, &c. are taught. A higher class of schools includes also foreign languages. All are under government inspectors, and the teachers must undergo stringent examinations on all the branches before obtaining permission to teach. Many society or subscription schools are being erected all over the land, with a normal school at Nymegen, not under government surveillance, and including religious instruction, which is excluded from the national public schools. The members of these

# NETTLE-NETTLE-RASH.

over the open hatchways during fine weather, to prevent persons from falling through.

**NETTLE** (*Urtica*), a genus of plants of the natural order *Urticeæ*, having unisexual flowers, the male and female on the same or separate plants; the male flowers with a 4-parted perianth, and four stamens; the female flowers with a 2-parted perianth and a tufted stigma; the fruit an acheneum. The species are herbaceous plants, shrubs, or even trees, many of them covered with stinging hairs, which pierce the skin when touched, and emit an acrid juice, often causing much inflammation and pain. When a N. is grasped in such a way as to press the hairs to the stem, no stinging ensues; but the slightest inadvertent touch of some of the species produces very severe pain. The stinging of the native nettles of Europe is trifling in comparison with that of some East Indian species. *U. crenulata* is particularly notable for the severity of the pain which it produces, without either pustules or apparent inflammation. The first sensation is merely a slight tingling, but within an hour violent pain is felt, as if a red-hot iron were continually applied, and the pain extends far from the original spot, continues for about twenty-four hours and then abates, but is ready to return in its original intensity on the application of cold water, and does not cease for fully eight days. Cold water has a similar effect in increasing or renewing the pain of all kinds of nettles. Still more formidable than this species is *U. urensissima*, the *Devil's Leaf* of Timor. Of British species, the most venomous, but the most rare, is the **ROMAN N.** (*U. pilulifera*); next to it is the **SMALL N.** (*U. urens*), frequent about towns and villages, and in waste and cultivated ground; whilst the least venomous is the most common and only perennial species, the **GREAT N.** (*U. dioica*), everywhere abundant, but particularly near human habitations, or their former sites, the desolation of which it may be said to proclaim. The roots of nettles, boiled with alum, afford a yellow dye; and the juice of the stalks and leaves has been used to dye woollen stuffs of a beautiful and permanent green. The young shoots of *U. dioica* are used in some parts of Scotland and other countries as greens, and their peculiar flavour is much relished by some, although, in general, the use of them is confined to the poor; which, however, is probably the result of mere prejudice. Whatever it is that gives nettles their stinging power, is dissipated by boiling. The high value of nettles as food for swine, is well known to the peasantry of many countries; the Great N. is cultivated in Sweden for fodder of domestic animals; nettles are also highly esteemed as food for poultry, particularly for turkeys. The seeds are extremely nutritious to poultry; and are given to horses by jockeys, in order to make them lively when they are to be offered for sale. The stalks and leaves of nettles are employed in some parts of England, for the manufacture of a light kind of beer, called *N. beer*, which may be seen advertised at stalls, and in humble shops in Manchester and other towns. The *best* fibre of nettles is useful for textile purposes. Yarn and cloth, both of the coarsest and finest descriptions, can be made of it. The fibre of *U. dioica* was used by the ancient Egyptians, and is still used in Piedmont and other countries. When wanted for fibre, the plant is cut in the middle of summer, and treated like hemp. The names *N. Yarn* and *N. Cloth* are, however, now commonly given in most parts of Europe to particular linen and cotton fabrics.—The fibre of *U. cannabina*, a native of the south of Siberia and other middle parts of Asia, is much used; and from that of *U. Whitlavi*, both fine lace and strong ropes can be manufactured. The fibre

of *U. Japonica* is much used in Japan, and the *U. argentea* in the South Sea Islands; the *U. Canadensis* is used in Canada.—The web herbage of *U. membranacea* are used in Egypt as emmenagogue and aphrodisiac; and some similar properties are ascribed to *U. dioica*. *tuberosa* produces tubers, which are nutritious, are eaten in India, raw, boiled, or roasted. Australia produces a magnificent tree-nettle, *gigas*, abundant in some parts of New South Wales, ordinarily from 25 to 50 feet high, but some 120 or 140 feet, with trunk of great thickness, very large green leaves, which, when young, are violently. In some places, it forms a great impediment to the traveller.

**NETTLE-RASH**, or **URTICARIA** (lat. *urtica* a nettle), is the term applied to a common eruption on the skin. The eruption consists of wheals, or little solid eminences of irregular size and either white or red, or most commonly red and white, there being a white centre with red margin. The rash is accompanied with heat, itching, and irritation; the appearance of skin and the sensation being very much like appearance and feeling produced by the stinging nettles; and hence the origin of its names.

The disease may be either acute or chronic. In the acute form, feverishness usually precedes rash by a few hours, although sometimes they commence together. The disorder is always connected with some derangement of the digestive organs, it may often be traced to the imperfect digestion of special articles of food, such as oatmeal, the kernel of fruit, strawberries, cucumbers, mushrooms, especially oysters, mussels, and crabs, which eaten with perfect impunity by most persons. An hour or two after the offending substance has been swallowed, there is a feeling of nausea, with oppression about the pit of the stomach; the patient complains of giddiness, and the face frequently swells; the skin then begins to tingle, and eruption breaks forth; vomiting and diarrhoea supervene, and act as a natural cure; but when they do not occur, the violence of the disease usually subsides in a few hours, and the rash altogether disappears in a day or two.

The chronic form is often very troublesome, and frequently comes on periodically in the evening. Cases are reported in which persons have been afflicted for ten years continuously by this form of the disease. Patients have left off all their customary articles of diet, one by one, without success, meeting with relief; and hence it may be inferred, that although the disease depends in cases on a disordered condition of the digestive organs, it is not always the consequence of a special offending article having been swallowed.

The main treatment of the acute form consists in expelling the offending matter by an emetic and purgatives, and the cure is thus usually complete. In the chronic form, the patient should, in the first place, determine whether the rash is caused by a particular article of diet, and if this seems not to be the case, an attempt must be made to improve the state of the digestive organs. A few grains of rhubarb taken daily, just before breakfast, or before dinner, will sometimes effect a cure. If this simple remedy fails, Dr Watson recommends a trial of a draught composed of the infusion of serpentaria (about an ounce and a half) with a scruple each of the carbonates of magnesia and soda. He adds, that although external applications are usually of little avail, he has found dusting the itching surfaces with flour semolina affords temporary relief; and that a still more useful

Each community must have, at one elementary school, supported from the public funds, in which, besides the usual teaching, writing, arithmetic, history, geography, and foreign languages, the children receive instruction in the various occupations of the community, and the teachers are being trained to teach these branches in the school at the same time as the ordinary studies, and religious instruction is afforded to the national public-school children.

# NETHERLANDS TRADING COMPANY—NETLEY.

The N. have suffered much from floods, either caused by the breaking in of the sea, or by the descent of masses of water from Germany, while the rivers of the Rhine delta were blocked up with ice. The Zuider Zee (q. v.), which contains 1365 square miles, was of trifling extent till the flood of All Saints' Day, 1247, when the North Sea swallowed up a large tract of country. In 1277, the Dollart Gulf, in Groningen, was formed at the mouth of the Ems, by floods in the spring and autumn of that year, which destroyed 33 villages and 100,000 people. The immense waste of waters, known as the sunken South Holland Waarde, or Biesbosch, arose out of the breaking of one of the dykes, 1421, by which 72 villages were laid under water, only 34 of them reappearing. In modern times, great floods, but fortunately with only temporary results, have occurred in 1809, 1825, and 1855. That of 1855, which placed the town of Veenendaal, in Gelderland, and an extensive tract of country under water, was caused by a rapid thaw in the high lands of Germany pouring down torrents of water into the N. while the rivers were ice-locked after a winter of unusual severity.—See *Aardrijksbeschrijving Door, C. Beyer; Nederland-Geographisch-Historisch Overzicht Door, Luit. L. G. Beausar; Statistiek Jaarboek* (Witkamp, Amsterdam), an excellent book of reference, which is published yearly up to the present time; the Provincial Annual Reports, &c.

**NETHERLANDS TRADING COMPANY,** a chartered joint-stock association, with limited liability, formed to aid in developing the natural resources of the Dutch East Indian possessions. The Company possesses peculiar privileges, acting exclusively as the commission-agents of the Netherlands government in all import and export transactions with the colonies, as well as doing a large business as merchants. Private enterprise having failed to develop the trade of Java, after that island was restored to the Netherlands, King William I, in 1824, erected the Trading Company, with a capital of upwards of 3 millions sterling, not only becoming a large shareholder, but guaranteeing an interest of 4 per cent. on the paid-up capital. The early transactions were unprofitable, and in 1827 the king had to pay a part, and in 1830 the whole of the guaranteed interest. From that date, it has prospered and handed over, from the trade of Java (q. v.), large surplus balances into the national revenue. The head office of the directors is at Amsterdam, with agents at Rotterdam, Middelburg, Dordrecht, and Schiedam; the principal factory at Batavia, with agencies at the chief ports in Java and the other Netherlands possessions in the Eastern Archipelago. Large quantities of goods suited for the colonial markets are bought, shipped from Holland and sold by the Company, for the account and at the risk of government; all the produce derived from the crown-lands being also placed in the factories, forwarded to Holland, arranged according to quality, and disposed of at the Company's periodical sales in Amsterdam, Rotterdam, &c. In 1857, one-third part of the calicoes, drills, and shirtings sent to Java was by the Trading Company. In 1872, the Company's sales at Amsterdam and Rotterdam realised £5,698,708.

	Amsterdam.	Rotterdam.	Total.
Coffee, . .	£1,831,619	£1,481,592	£3,313,211
Sugar, . .	954,455	695,701	1,550,156
Tin, . . .	250,316	282,821	533,137
Spices, . .	.....	70,948	70,948
Various, . .	176,785	54,471	231,256

The Company's imports are coffee, sugar, tin, dyes, ratans, tobacco, cotton, nutmegs, cassia, silk, camphor, fine woods, &c. The present capital is 31 million

guilders, and 5 millions of a reserve fund £3,150,000. The amount of commission paid government is privately arranged according to circumstances. For many years the shares have been at a considerable premium, and the dividend average 10 per cent.

The success of the Trading Company depends mainly on the culture system, which was introduced into Java in 1830. Under the native the land belonged to the princes, and the cultivator paid one-fifth of the produce, and one-fifth of labour as ground-rent. The Dutch, by conquest, are now the proprietors of the greater part of the island, and exact the old produce rent, relaxing labour to one-seventh, and causing the holder of crown-lands to plant one-fifth of their cultivated land with the crop best adapted for the soil and required for the European market. The government also supplied, free of interest, enterprising young men with the capital necessary to erect and carry out works for the preparation of the raw material to be repaid in ten yearly instalments, beginning the third year. The landholders of a certain tract allotted to a sugar-mill were bound to supply a fixed quantity, receiving advances upon the land to enable them to bring it forward. The rule of fixed quantity was relaxed in 1860, and has caused great discontentment among the contractors. European residents and their assistants, the natives, princes, chiefs, and village head-men, receive a percentage according to the quantity which is manufactured from the produce delivered, so that all are interested in taking care that the lands are cultivated and the crops cared for. Sugar, tobacco, tea are prepared by contractors; indigo, cochineal, coffee, cinnamon, and pepper by the natives under European surveillance, all passing into the Trading Company's factories for shipment to the Netherlands. The objections to the system are, that it does not leave the labour of the natives free, and that the passing of so much of the export and import trade through one favoured company injures the general merchant. On the other hand, it must be said that the Dutch government only carries out the old rule, and it is therefore not regarded by the peasants as an infringement of their rights; and the merchants and capitalists of the Netherlands did not of themselves put forth sufficient efforts to work out the natural capabilities of Java when it returned to Dutch rule.

**NETLEY, ROYAL VICTORIA HOSPITAL AT,** a superb building, on the shore of Southampton Water, for the reception of invalids from the army on furlough, and from among the troops serving in adjoining military districts. In times of peace, it is only necessary to use a portion of the vast structure; but in the event of a European war, which the British army should take part in, the exigencies of the service would probably tax the accommodation to the utmost. There is provision for 1000 patients, with power to increase the number if necessary. The medical staff of course varies in proportion to the work to be done; but at present (1874) it consists of a governor, an adjutant, a paymaster, an assistant-commandant, and medical officers, and officers of orderlies of various ranks. The total cost of the construction of this hospital, which was commenced in 1855, has been about £350,000. Attached is the Medical School, where candidates for the army medical department, students having the best means of practical instruction in the wards of the hospital. N. is also headquarters of the female nurses of the army, who are under the control of a lady stationed here as superintendent. Complete arrangements have been made for the landing of wounded men in the

## NETS—NETTING.

of the hospital, and for conveying them thither with the least disturbance. There is no doubt as to the convenience of this great hospital for its purposes; but some questions have been raised, under high sanitary authority, as to the salubrity of the site, adjacent as it is to the wide banks of mud which Southampton Water uncovers at low tide.

NETS are fabrics in which the threads cross each other at right angles, leaving a comparatively large open space between them; the threads are also knotted at the intersections. In this respect, netting differs essentially from weaving, where the intersecting threads simply cross each other. The open spaces in nets are called *meshes*, and these correspond in size with an instrument used in net-making, consisting of a flat piece of wood or other hard substance, usually about the shape and size of a common paper-knife. In addition to this, a peculiar kind of needle (fig. 1) is used, upon which a large quantity of the thread is placed, by winding it from end to end between the forked extremities; the holes

Fig. 1.

are used to insert the end of the thread, to prevent it slipping off at the commencement of the winding. The art of net-making has been practised from the earliest times by the most savage as well as the most civilised nations. Even where the art of weaving was quite unknown, as in some of the South Sea Islands when first discovered, that of netting was well understood; and it is easy to see that the human race could not help learning the value of this art from seeing how frequently land and water animals get entangled in the shrubs and weeds through which they attempt to pass; hence we find amongst savage tribes, almost universally, nets are used not only for fishing, as with us, but also for entrapping land animals. We have ample illustrations of the uses of nets for both purposes in the bas-reliefs of Assyria, Greece, and Rome, and in the mural paintings of Egypt.

Until recently, nets have been always made by hand, and generally the thread has been a more or less thick twine of hemp or flax, the thickness of the twine and the size of the mesh depending upon the kind of fish for which it was made; recently, however, great improvements have been made in the manufacture of nets, and machinery of a most beautiful automatic kind has been introduced by Messrs Stuart of Musselburgh, whose manufactory is of vast extent. This establishment commences with the raw materials, which are hemp, flax, and cotton, the last having been extensively employed for herring and sprat nets of late years. Hemp, however, is the chief material for net-making; and in order to prepare it, it is first passed in long rolls through a machine consisting of two rollers with blunt ridges, the upper of which is kept down on the material by means of a hanging weight, consisting of a loaded box suspended to a chain from the axle of the roller. After the fibre has passed through this, it is much more supple than before, and is then *hackled*; this process is also done by machinery, which was first introduced into this manufactory for hemp-hackling, and succeeds admirably. It subsequently passes through the carding, roving, and spinning processes, as in all other kinds of yarn, and is finally twisted into threads or twines of the required thickness. Messrs Stuart have in one room 4000 spindles at work, besides the carding and twist machines. Of their patent loom they have 200 at work, the largest

of which makes nets 480 meshes in width. It would be useless to attempt to describe these ingenious looms, which are worked by hand, otherwise than by saying that their leading features are like the stocking-frames; a series of sinkers push forward, pull down, and pass in and out the thread, which is carried from one side of the web to the other by long iron needles, which act as shuttles passing not over-quickly from a long box on each side of the loom, as in fig. 2, which shews the box, *a*, with

Fig. 2.

shuttle-needle, *b*, protruded; *c* is the bobbin of twine which feeds the needle, and for this purpose must have a conical form, which is most ingeniously given it by a special contrivance, in the twisting-machine; *d, d, d* are small rings, through which the twine, *ee*, passes, to prevent it being given off too quickly, or in knots or kinks. This simple yet most effective contrivance is worked by wheels and jointed rods, and might be advantageously applied to many other purposes. After the net comes from the loom, it goes to the finishers, who, by hand, make the addition of a kind of selvage, consisting of several thicknesses of twine, to give strength to the edges. The nets are then ready for use, and are sent in vast numbers to all parts of the world. Machine net-making is now becoming general.

A great variety of nets are in use amongst fishermen, but the principal are the *seine*, *trawl*, and *drift nets*. The *seine* is a very long but not very wide net, one side of which is loaded with pieces of lead, and consequently sinks; the other, or upper, is buoyed with pieces of cork, and consequently is kept up to the surface. Seines are sometimes as much as 190 fathoms in length. When stretched out, they constitute walls of network in the water, and are made to enclose vast shoals of fish. The *trawl* is dragged along the bottom by the fishing-boat; and the *drift-net* is like the *seine*, but is not loaded with lead; it is usually employed for mackerel fishing.

Various kinds of nets are used in bird-catching, one of which is noticed in the article CLAP-NET. Nets are used in catching quadrupeds, chiefly for the purpose of enclosing spaces within which they are, but sometimes also for throwing upon them to confuse and entangle them.

Nets are used by gardeners to protect crops from birds; also to protect the blossoms of trees from frost, and it is wonderful how well this object is accomplished, even when the meshes are pretty wide, and the sun's rays have very free access.

NETTING, NAVAL. A *boarding-netting* is formed of strong rope, and stretched above the bulwarks of a ship, over the port-holes, &c., to a considerable height, for the purpose of preventing the entrance of boarders from hostile boats. In positions where boat attacks are feasible, ships are thus protected at night, and at other times when attempts at boarding are anticipated.

The *hammock-netting* is in the bulwarks of a ship, usually in the waist, and its purpose is to keep the hammocks of the crew when stowed there during the day; thus netted together, the hammocks form a valuable barrier against bullets.

*Hatchway-nettings* are of inch rope, and are placed

## NETTLE—NETTLE-RASH.

over the open hatchways during fine weather, to prevent persons from falling through.

**NETTLE** (*Urtica*), a genus of plants of the natural order *Urticæ*, having unisexual flowers, the male and female on the same or separate plants; the male flowers with a 4-parted perianth, and four stamens; the female flowers with a 2-parted perianth and a tufted stigma; the fruit an acheneum. The species are herbaceous plants, shrubs, or even trees, many of them covered with stinging hairs, which pierce the skin when touched, and emit an acrid juice, often causing much inflammation and pain. When a *N.* is grasped in such a way as to press the hairs to the stem, no stinging ensues; but the slightest inadvertent touch of some of the species produces very severe pain. The stinging of the native nettles of Europe is trifling in comparison with that of some East Indian species. *U. crenulata* is particularly notable for the severity of the pain which it produces, without either pustules or apparent inflammation. The first sensation is merely a slight tingling, but within an hour violent pain is felt, as if a red-hot iron were continually applied, and the pain extends far from the original spot, continues for about twenty-four hours and then abates, but is ready to return in its original intensity on the application of cold water, and does not cease for fully eight days. Cold water has a similar effect in increasing or renewing the pain of all kinds of nettles. Still more formidable than this species is *U. urentissima*, the *Devil's Leaf* of Timor. Of British species, the most venomous, but the most rare, is the **ROMAN N.** (*U. pilulifera*); next to it is the **SMALL N.** (*U. urens*), frequent about towns and villages, and in waste and cultivated ground; whilst the least venomous is the most common and only perennial species, the **GREAT N.** (*U. dioica*), everywhere abundant, but particularly near human habitations, or their former sites, the desolation of which it may be said to proclaim. The roots of nettles, boiled with alum, afford a yellow dye; and the juice of the stalks and leaves has been used to dye woollen stuffs of a beautiful and permanent green. The young shoots of *U. dioica* are used in some parts of Scotland and other countries as greens, and their peculiar flavour is much relished by some, although, in general, the use of them is confined to the poor; which, however, is probably the result of mere prejudice. Whatever it is that gives nettles their stinging power, is dissipated by boiling. The high value of nettles as food for swine, is well known to the peasantry of many countries; the Great *N.* is cultivated in Sweden for fodder of domestic animals; nettles are also highly esteemed as food for poultry, particularly for turkeys. The seeds are extremely nutritious to poultry; and are given to horses by jockeys, in order to make them lively when they are to be offered for sale. The stalks and leaves of nettles are employed in some parts of England, for the manufacture of a light kind of beer, called *N. beer*, which may be seen advertised at stalls, and in humble shops in Manchester and other towns. The *bast* fibre of nettles is useful for textile purposes. Yarn and cloth, both of the coarsest and finest descriptions, can be made of it. The fibre of *U. dioica* was used by the ancient Egyptians, and is still used in Piedmont and other countries. When wanted for fibre, the plant is cut in the middle of summer, and treated like hemp. The names *N. Yarn* and *N. Cloth* are, however, now commonly given in most parts of Europe to particular linen and cotton fabrics.—The fibre of *U. cannabina*, a native of the south of Siberia and other middle parts of Asia, is much used; and from that of *U. Whitlani*, both fine lace and strong ropes can be manufactured. The fibre

of *U. Japonica* is much used in Japan, *U. arvensis* in the South Sea Islands, *U. Canadensis* is used in Canada.—The herbage of *U. membranacea* are used emmenagogue and aphrodisiac; and similar properties are ascribed to *U. tuberosa* produces tubers, which are not eaten in India, raw, boiled, or Australia produces a magnificent tree *gigas*, abundant in some parts of New Guinea, ordinarily from 25 to 50 feet high, but 120 or 140 feet, with trunk of great thickness, very large green leaves, which, when touched, sting violently. In some places, it forms a dense thicket, and its stinging leaves form a great impediment to the traveller.

**NETTLE-RASH**, or **URTICARIA** (a nettle), is the term applied to a common eruption on the skin. The eruption consists of wheals, or little solid eminences of irregular shape, and either white or red, or most commonly red and white, there being a white or red margin. The rash is accompanied by heat, itching, and irritation; the appearance and the sensation being very much like those produced by the stinging of nettles; and hence the origin of its name.

The disease may be either acute or chronic. In the acute form, feverishness usually precedes the rash by a few hours, although sometimes the two commence together. The disorder is always attended with some derangement of the digestive system. It may often be traced to the imperfect assimilation of special articles of food, such as oatmeal, of fruit, strawberries, cucumbers, mushrooms, especially oysters, mussels, and crabs, eaten with perfect impunity by most persons. Within an hour or two after the offending substance has been swallowed, there is a feeling of nausea, and a burning sensation about the pit of the stomach; the patient complains of giddiness, and the face swells; the skin then begins to tingle, and the eruption breaks forth; vomiting and diarrhoea supervene, and act as a natural cure. When they do not occur, the violence of the attack usually subsides in a few hours, and the rash altogether disappears in a day or two.

The chronic form is often very troublesome, frequently comes on periodically in the same places. Cases are reported in which persons have been afflicted for ten years continuously by the disease. Patients have left off all ordinary articles of diet, one by one, with the hope of meeting with relief; and hence it is inferred, that although the disease depends on a disordered condition of the digestive organs, it is not always the consequence of a special offending article having been swallowed.

The main treatment of the acute form consists in expelling the offending matter by an emetic, and the cure is thus usually effected. In the chronic form, the patient should, in the first place, determine whether the rash is caused by a particular article of diet, and if this can be ascertained, an attempt must be made to abstain from the state of the digestive organs. A draught of rhubarb taken daily, just before breakfast, will sometimes effect a cure. If a simple remedy fails, Dr Watson recommends a draught composed of the decoction of serpentaria (about an ounce) with a scruple each of the carbonates of potassium and soda. He adds, that although external applications are usually of little avail, he has found dusting the itching surface with flour affords temporary relief; and that a still

application is a lotion composed of a drachm of the carbonate of ammonia, a drachm of the acetate of lead, half an ounce of laudanum, and eight ounces of rose-water.

**NETTLE-TREE** (*Celtis*), a genus of deciduous trees of the natural order *Ulmaceae*, with simple and generally serrated leaves, considerably resembling those of the Common Nettle, but not stinging. The genus is distinguished chiefly by its fruit, which is a fleshy, globose, or sub-globose 1-celled drupe. The Common or European N. T. (*C. Australis*) is a native of the south of Europe, the west of Asia, and the north of Africa. It grows to the height of 30–40 feet, and is a very handsome tree, often planted along public walks in the south of France and north of Italy. The wood is very compact, very durable, and takes a high polish. It was formerly much imported into Britain for the use of coachmakers. It is used in Italy by musical-instrument makers for flutes and pipes. The flowers are inconspicuous, axillary, and solitary; the fruit black, resembling a small wild cherry, not eatable till after the first frosts, and then very sweet. The kernel yields a useful fixed oil. The tree succeeds well in the south of England.—*C. occidentalis* is a native of North America from Canada to Carolina, sometimes there called the N. T., sometimes the SUGAR BERRY. Its leaves are much broader than those of *C. Australis*, its fruit very similar. It is a much larger tree, attaining a height of 60–80 feet.—Another American species, *C. crassifolia*, often called HACKBERRY or HAGBERRY, and HOOP ASH, is very abundant in the basin of the Ohio and westward of the Mississippi. It grows to a great height, but the trunk is not very thick. The wood is not much valued, but is said to make very fine charcoal. The fruit is black, and about the size of a pea.—The inner bark of *C. orientalis*, consisting of reticulated fibres, forms a kind of natural cloth, used by some tribes of India.—A number of other species are natives of the warm parts of America and of Asia.

**NEU-BRANDENBURG**, a town of Mecklenburg-Strelitz, and the largest and most beautiful in the duchy, is situated on Lake Tollens, 17 miles north-north-east of Neu-Strelitz. It is regularly built, contains two churches, a castle, &c., is the centre of a picturesque district, and the seat of considerable industry. Pop. (1871) 7245.—About half a league from N., on a rock overlooking Lake Tollens, stands the ducal pleasure-castle of Belvedere, commanding, it is said, the most beautiful prospect in Mecklenburg.

**NEUBURG**, an ancient town of Bavaria, is picturesquely situated on the right bank of the Danube, 29 miles north-north-east of Augsburg. It contains a handsome palace, the chateau of the Dukes of Bavaria of the line of Pfalz-Neuburg, who resided here from 1596 to 1742. The palace contains a collection of ancient armour. Brewing and distilling are carried on, and there is a considerable commercial trade on the Danube. Pop. (1871) 6390.

**NEUFCHÂTEL**, or **NEUCHÂTEL**, known also as *Neuenburg*, a canton in the west of Switzerland, between Lake Neuchâtel and the French frontier, in lat. 46° 52'—47° 10' N., and long. 6° 26'—7° 5' E. Area, 304 square miles. Population, 97,284, at the close of 1870. N. lies in the midst of the Jura Mountains, four chains of which, running from north-east to south-west, traverse the canton, and are separated by elevated longitudinal valleys. The most easterly of these is a broken chain, running parallel to the lake of Neuchâtel, the vine is carefully cultivated. chain has five principal passes, the

which, La Tourne, has an elevation of about 4000 feet. The third and fourth ranges, abutting on France, consist for the most part of barren hills, separated by elevated valleys; but here and there these high lands are well wooded and fruitful, producing corn, good pasture, fruits, &c. The greater number of the numerous streams which water the canton flow into the Rhine. Among these mountain torrents, the principal are the Reuse, the Seyon, and the Serriere, the two former of which, together with the rivers Orbe and Broie, are the feeders of the Lake of Neuchâtel, known also as the Lake of Yverdon. The Thiele serves as its outlet, and carries its waters into the neighbouring lake of Bienné, and into the river Aar. The lake is 25 miles long, and from 3 to 5½ miles wide. Its level above the sea is 1420 feet, and it has a depth of 400 or 500 feet.

The natural products are iron ores, coal, asphalt, fruit, including grapes—from which good red and white wines are made—timber and corn, although the latter is not grown in sufficient quantity for the demands of the home consumption. The rearing of cattle constitutes an important branch of industry, and large quantities of cheese are exported; but the speciality of the canton is watch-making, which occupies from 18,000 to 20,000 persons, and is prosecuted in detail at the homes of the work-people, in the rural districts, where some families manufacture only special parts of the machinery, while others are engaged solely in putting together the separate portions that have been manufactured by others; and the watches thus prepared are exported in large quantities to every part of Europe and America. Muslin-printing employs upwards of 10,000 persons, and lace is extensively made by the country-women of the Val de Travers.

The climate of N. varies greatly with the locality; being temperate on the shores of the lake, cooler in the valleys, and severe on the mountain-sides. The population, with the exception of between 9000 and 10,000 Catholics, belongs to various Protestant denominations.

The history of N. was identical with that of Burgundy, till the 11th c.; and after the primories had been for a time incorporated with the d. of the Counts of Chalons, to whom it passed granted in 1288, by Rudolph of Hapsburg, the extinct to the House of Longueville. In 1707 family, 15 tion of the N. branch of the 1 more or less claimants came forward to add. Frederick I. valid pretensions to the N. to the principality of Prussia, who based his claim from the first of N. on the ground of part of the House of Prince of Orange, a d. candidate; and from Chalons, was the suc. ciated with Prussia till his time it continued estowed it upon General 1806, when Nap. was restored to the House of Berthier; but in wholly dissolved since 1857, and monarchy h. of the Swiss Confederation.

N. is now, EL, or **NEUCHÂTEL**, is the chief town, and occupies a magnificent site town ed for its many charitable institutions, on the beauty of its charmingly situated, ap. Pop. (1870) 13,321.

**O'HAUS**, a town of Bohemia, on the marka, about 70 miles south-south-east of Prague. Its palace, belonging to Count Czerny, is a splendid edifice. Cloth, paper, and chemical products are manufactured. Pop. 8620.

**NEUHAUSEL** (Hung. *Ersek-Ujvár*), a town of Hungary, on the right bank of the Neutra, 74 miles

over the open hatchways during fine weather, to prevent persons from falling through.

**NETTLE** (*Urtica*), a genus of plants of the natural order *Urticeæ*, having unisexual flowers, the male and female on the same or separate plants; the male flowers with a 4-parted perianth, and four stamens; the female flowers with a 2-parted perianth and a tufted stigma; the fruit an achenium. The species are herbaceous plants, shrubs, or even trees, many of them covered with stinging hairs, which pierce the skin when touched, and emit an acrid juice, often causing much inflammation and pain. When a N. is grasped in such a way as to press the hairs to the stem, no stinging ensues; but the slightest inadvertent touch of some of the species produces very severe pain. The stinging of the native nettles of Europe is trifling in comparison with that of some East Indian species. *U. crenulata* is particularly notable for the severity of the pain which it produces, without either pustules or apparent inflammation. The first sensation is merely a slight tingling, but within an hour violent pain is felt, as if a red-hot iron were continually applied, and the pain extends far from the original spot, continues for about twenty-four hours and then abates, but is ready to return in its original intensity on the application of cold water, and does not cease for fully eight days. Cold water has a similar effect in increasing or renewing the pain of all kinds of nettles. Still more formidable than this species is *U. urentissima*, the *Devil's Leaf* of Timor. Of British species, the most venomous, but the most rare, is the **ROMAN N.** (*U. pilulifera*); next to it is the **SMALL N.** (*U. urens*), frequent about towns and villages, and in waste and cultivated ground; whilst the least venomous is the most common and only perennial species, the **GREAT N.** (*U. dioica*), everywhere abundant, but particularly near human habitations, or their former sites, the desolation of which it may be said to proclaim. The roots of nettles, boiled with alum, afford a yellow dye; and the juice of the stalks and leaves has been used to dye woollen stuffs of a beautiful and permanent green. The young shoots of *U. dioica* are used in some parts of Scotland and other countries as greens, and their peculiar flavour is much relished by some, although, in general, the use of them is confined to the poor; which, however, is probably the result of mere prejudice. Whatever it is that gives nettles their stinging power, is dissipated by boiling. The high value of nettles as food for swine, is well known to the peasantry of many countries; the Great N. is cultivated in Sweden for fodder of domestic animals; nettles are also highly esteemed as food for poultry, particularly for turkeys. The seeds are extremely nutritious to poultry; and are given to horses by jockeys, in order to make them lively when they are to be offered for sale. The stalks and leaves of nettles are employed in some parts of England, for the manufacture of a light kind of beer, called *N. beer*, which may be seen advertised at stalls, and in humble shops in Manchester and other towns. The *bast* fibre of nettles is useful for textile purposes. Yarn and cloth, both of the coarsest and finest descriptions, can be made of it. The fibre of *U. dioica* was used by the ancient Egyptians, and is still used in Piedmont and other countries. When wanted for fibre, the plant is cut in the middle of summer, and treated like hemp. The names *N. Yarn* and *N. Cloth* are, however, now commonly given in most parts of Europe to particular linen and cotton fabrics.—The fibre of *U. cannabina*, a native of the south of Siberia and other middle parts of Asia, is much used; and from that of *U. Whitlavi*, both fine lace and strong ropes can be manufactured. The fibre

of *U. Japonica* is much used in Japan, and *U. argentea* in the South Sea Islands; *U. Canadensis* is used in Canada.—The herbage of *U. membranacea* are used in E. emmenagogue and aphrodisiac; and some similar properties are ascribed to *U. dioica*. *tuberosa* produces tubers, which are nutritious are eaten in India, raw, boiled, or roasted. Australia produces a magnificent tree-net *gigas*, abundant in some parts of New South Wales, ordinarily from 25 to 50 feet high, but some 120 or 140 feet, with trunk of great thickness, very large green leaves, which, when young, are violently. In some places, it forms scrub, and its stinging leaves form a great impediment to the traveller.

**NETTLE-RASH**, or **URTICARIA** (Lat. a nettle), is the term applied to a common eruption on the skin. The eruption consists of wheals, or little solid eminences of irregular shape, and either white or red, or most commonly red and white, there being a white centre and red margin. The rash is accompanied with heat, itching, and irritation; the appearance of the skin and the sensation being very much like the appearance and feeling produced by the stinging of nettles; and hence the origin of its name.

The disease may be either acute or chronic. In the acute form, feverishness usually precedes the rash by a few hours, although sometimes the two mence together. The disorder is always connected with some derangement of the digestive organs; it may often be traced to the imperfect digestion of special articles of food, such as oatmeal, the use of fruit, strawberries, cucumbers, mushrooms, especially oysters, mussels, and crabs, which, when eaten with perfect impunity by most persons, a few hours or two after the offending substance has been swallowed, there is a feeling of nausea, with a sensation about the pit of the stomach; the patient complains of giddiness, and the face frequently swells; the skin then begins to tingle, and an eruption breaks forth; vomiting and diarrhoea supervene, and act as a natural cure; but when they do not occur, the violence of the disease usually subsides in a few hours, and the rash altogether disappears in a day or two.

The chronic form is often very troublesome, frequently comes on periodically in the autumn. Cases are reported in which persons have been afflicted for ten years continuously by this form of the disease. Patients have left off all the usual dietary articles of diet, one by one, without effect, cases meeting with relief; and hence it is inferred, that although the disease depends on a disordered condition of the digestive organs, it is not always the consequence of a special offending article having been swallowed.

The main treatment of the acute form consists in expelling the offending matter by an emetic, followed by purgatives, and the cure is thus usually completed. In the chronic form, the patient should, in the first place, determine whether the rash is caused by a particular article of diet, and if this seems to be the case, an attempt must be made to restore the state of the digestive organs. A few cases of rhubarb taken daily, just before breakfast, before dinner, will sometimes effect a cure. If a simple remedy fails, Dr Watson recommends a trial of a draught composed of the infusion of serpentaria (about an ounce and a half) with a scruple each of the carbonates of magnesia and soda. He adds, that although external applications are usually of little avail, he has found dusting the itching surface with flour and soda affords temporary relief; and that a still more

# NETTLE-TREE—NEUHAUSEL.

application is a lotion composed of a drachm of the carbonate of ammonia, a drachm of the acetate of lead, half an ounce of laudanum, and eight ounces of rose-water.

**NETTLE-TREE** (*Celtis*), a genus of deciduous trees of the natural order *Ulmaceae*, with simple and generally serrated leaves, considerably resembling those of the Common Nettle, but not stinging. The genus is distinguished chiefly by its fruit, which is a fleshy, globose, or sub-globose 1-celled drupe. The Common or European N. T. (*C. Australis*) is a native of the south of Europe, the west of Asia, and the north of Africa. It grows to the height of 30–40 feet, and is a very handsome tree, often planted along public walks in the south of France and north of Italy. The wood is very compact, very durable, and takes a high polish. It was formerly much imported into Britain for the use of coachmakers. It is used in Italy by musical-instrument makers for flutes and pipes. The flowers are inconspicuous, axillary, and solitary; the fruit black, resembling a small wild cherry, not eatable till after the first frosts, and then very sweet. The kernel yields a useful fixed oil. The tree succeeds well in the south of England.—*C. occidentalis* is a native of North America from Canada to Carolina, sometimes there called the N. T., sometimes the SUGAR BERRY. Its leaves are much broader than those of *C. Australis*, its fruit very similar. It is a much larger tree, attaining a height of 60–80 feet.—Another American species, *C. crassifolia*, often called HACKBERRY or HARBERRY, and HOOP ASH, is very abundant in the basin of the Ohio and westward of the Mississippi. It grows to a great height, but the trunk is not very thick. The wood is not much valued, but is said to make very fine charcoal. The fruit is black, and about the size of a pea.—The inner bark of *C. orientalis*, consisting of reticulated fibres, forms a kind of natural cloth, used by some tribes of India.—A number of other species are natives of the warm parts of America and of Asia.

**NEU-BRANDENBURG**, a town of Mecklenburg-Strelitz, and the largest and most beautiful in the duchy, is situated on Lake Tollens, 17 miles north-north-east of Neu-Strelitz. It is regularly built, contains two churches, a castle, &c., is the centre of a picturesque district, and the seat of considerable industry. Pop. (1871) 7245.—About half a league from N., on a rock overlooking Lake Tollens, stands the ducal pleasure-castle of Belvedere, commanding, it is said, the most beautiful prospect in Mecklenburg.

**NEUBURG**, an ancient town of Bavaria, is picturesquely situated on the right bank of the Danube, 29 miles north-north-east of Augsburg. It contains a handsome palace, the château of the Dukes of Bavaria of the line of Pfalz-Neuburg, who resided here from 1596 to 1742. The palace contains a collection of ancient armour. Brewing and distilling are carried on, and there is a considerable commercial trade on the Danube. Pop. (1871) 6390.

**NEUFCHATEL**, or **NEUCHATEL**, known also as *Neuenburg*, a canton in the west of Switzerland, between Lake Neufchatel and the French frontier, in lat. 46° 52'—47° 10' N., and long. 6° 26'—7° 5' E. Area, 304 square miles. Population, 97,284, at the close of 1870. N. lies in the midst of the Jura Mountains, four chains of which, running from north-east to south-west, traverse the canton, and are separated by elevated longitudinal valleys. The most easterly of these is a broken chain, running parallel to the lake of Neufchatel, on whose banks, and on the second and lower ranges beyond it, the vine is carefully cultivated. This second chain has five principal passes, the highest of

which, La Tourne, has an elevation of about 4000 feet. The third and fourth ranges, abutting on France, consist for the most part of barren hills, separated by elevated valleys; but here and there these high lands are well wooded and fruitful, producing corn, good pasture, fruits, &c. The greater number of the numerous streams which water the canton flow into the Rhine. Among these mountain torrents, the principal are the Reuse, the Seyon, and the Serriere, the two former of which, together with the rivers Orbe and Broie, are the feeders of the Lake of Neufchatel, known also as the Lake of Yverdon. The Thiele serves as its outlet, and carries its waters into the neighbouring lake of Bienné, and into the river Aar. The lake is 25 miles long, and from 3 to 5½ miles wide. Its level above the sea is 1420 feet, and it has a depth of 400 or 500 feet.

The natural products are iron ores, coal, asphalt, fruit, including grapes—from which good red and white wines are made—timber and corn, although the latter is not grown in sufficient quantity for the demands of the home consumption. The rearing of cattle constitutes an important branch of industry, and large quantities of cheese are exported; but the speciality of the canton is watch-making, which occupies from 18,000 to 20,000 persons, and is prosecuted in detail at the homes of the work-people, in the rural districts, where some families manufacture only special parts of the machinery, while others are engaged solely in putting together the separate portions that have been manufactured by others; and the watches thus prepared are exported in large quantities to every part of Europe and America. Muslin-printing employs upwards of 10,000 persons, and lace is extensively made by the country-women of the Val de Travers.

The climate of N. varies greatly with the locality; being temperate on the shores of the lake, cooler in the valleys, and severe on the mountain-sides. The population, with the exception of between 9000 and 10,000 Catholics, belongs to various Protestant denominations.

The history of N. was identical with that of Burgundy, till the 11th c.; and after the principality had been for a time incorporated with the territories of the Counts of Chalons, to whom it had been granted in 1288, by Rudolph of Hapsburg, it passed to the House of Longueville. In 1707, on the extinction of the N. branch of the latter family, 15 claimants came forward to advance more or less valid pretensions to the N. territory. Frederick I. of Prussia, who based his claim to the principality of N. on the ground of his descent from the first Prince of Orange, a descendant of the House of Chalons, was the successful candidate; and from his time it continued associated with Prussia till 1806, when Napoleon bestowed it upon General Berthier; but in 1814, it was restored to the House of Brandenburg. This connection with the Prussian monarchy has been wholly dissolved since 1857, and N. is now a member of the Swiss Confederation.

**NEUFCHATEL**, or **NEUENBURG**, is the chief town of the canton, and occupies a magnificent site on the north-west shore of the Lake of Neufchatel, and is noted for its many charitable institutions, and for the beauty of its charmingly situated environs. Pop. (1870) 13,321.

**NEUHAUS**, a town of Bohemia, on the Nescharka, about 70 miles south-south-east of Prague. Its palace, belonging to Count Czerny, is a splendid edifice. Cloth, paper, and chemical products are manufactured. Pop. 8620.

**NEUHAUSEL** (Hung. *Eresek-Ujvár*), a town of Hungary, on the right bank of the Neutra, 74 miles

north-west of Pesth, by the Vienna and Pesth Railway. It was formerly strongly fortified, and played an important part in the Turkish wars. No traces of its fortifications now remain. Pop. 9483, chiefly engaged in agriculture and the rearing of cattle.

**NEURALGIA** (Gr. *neuron*, a nerve; *algos*, pain) is a term employed to designate pain of a purely nervous character, usually unaccompanied by inflammation, fever, or any appreciable change of structure. The pain, which occurs in paroxysms, usually followed by complete remissions, is of every possible degree and character, being described in different cases as piercing, tearing, burning, &c. These paroxysms may occur at intervals of a few seconds only, or they may take place daily or on alternate days, or they may be separated by much longer intervals, which are often, but by no means always, of a regular length. With the pain, there is frequently spasmodic twitching of the adjacent muscles. The duration of the disease is very uncertain. The patient may have only a single attack, or he may be liable to recurring attacks for months, years, or even for his whole life; it is, however, very seldom that the disease occurs but once. Death scarcely ever results directly from this affection, but the pain may, by its severity and persistence, gradually undermine the constitution.

The disease may attack any part of the body where there are nerves; but in no part does it occur so frequently as in the face, when it is popularly known as *Tic Douloureux*; its seat being in the facial branches of the fifth pair of nerves (the trifacial nerves—see fig. 2 in NERVES). The following graphic description of the ordinary varieties of this form of neuralgia is borrowed from Dr Watson's *Lectures on the Principles and Practice of Physic*: 'When the uppermost branch of the trifacial nerve is the seat of the complaint, the pain generally shoots from the spot where the nerve issues through the superciliary hole; and it involves the parts adjacent, upon which the fibrils of the nerve are distributed—the forehead, the brow, the upper lid, sometimes the eye-ball itself. The eye is usually closed during the paroxysm, and the skin of the forehead on that side corrugated. The neighbouring arteries throb, and a copious gush of tears takes place. In some instances, the eye becomes blood-shot at each attack; and when the attacks are frequently repeated, this injection of the conjunctiva may become permanent.

'When the pain depends upon a morbid condition or morbid action of the middle branch of the nerve, it is sometimes quite sudden in its accession, and sometimes comes on rather more gradually; being preceded by a tickling or pricking sensation of the cheek, and by twitches of the lower eyelid. These symptoms are shortly followed by pain at the infra-orbital foramen, spreading in severe flashes (so to speak) over the cheek, affecting the lower eyelid, ala nasi, and upper lip, and often terminating abruptly at the mesial line of the face. Sometimes it extends to the teeth, the antrum, the hard and soft palate, and even to the base of the tongue, and induces spasmodic contractions of the neighbouring muscles.

'When the pain is referrible to the inferior or maxillary branch of the fifth pair of nerves, it darts from the mental foramen, radiating to the lips, the alveolar processes, the teeth, the chin, and to the side of the tongue. It often stops exactly at the symphysis of the chin. Frequently it extends in the other direction, to the whole cheek and to the ear. During the paroxysm, the features are liable to be distorted by spasmodic action of the muscles of the jaw, amounting sometimes to tetanic rigidity, and holding the jaw fixed and immovable.

'The paroxysms of suffering in this frightful disease are apt to be brought on by apparently trivial causes—by a slight touch, by a current of air blowing upon the face, by a sudden jar or shake of the bed on which the patient is lying, by a knock at the door, or even by directing the patient's attention to his malady, by speaking of it or asking him questions about it. The necessary movements of the face in speaking or eating are often sufficient to provoke or renew the paroxysm. At the same time, firm pressure made upon the painful part frequently gives relief, and causes a sense of numbness to take the place of the previous agony' (vol. i. pp. 723, 724).

*Tic douloureux* is the form of severe neuralgia which is by far the most commonly met with; the reason probably being, that the trifacial nerve, lying superficially, and being distributed over a part of the surface which is usually unprotected by any artificial covering, is very liable, for that reason, to be affected by exposure to atmospheric influences, which are undoubtedly to be included among the exciting causes of this disease. Amongst other seats of neuralgia may be mentioned the arm, especially the forearm, the spaces between the ribs, especially between the sixth and ninth, and the lower extremity, where it most frequently affects the sciatic nerve, giving rise to the affection known as *SCIATICA*, which, however, not always being pure neuralgia, will be noticed in a separate article.

The causes of neuralgia are various. Excluding inflammation of the nervous trunk or *neuritis*, the pain may be excited by a tumour pressing on the nerve, or originating in its substance; or by roughness of a bony surface with which the nerve may be in contact, as when it passes through a foramen; or it may be due to tumours within the cranium, or a morbid state of the spinal cord. Sometimes, again, irritation applied to one branch of a nerve will give rise to pain at the extremity of another branch of the same nerve, the sensation being reflected along the branch which is not directly exposed to the irritation. In this way we may explain the pain in the shoulder which often accompanies disease of the liver; the pain in the thigh, which is often associated with irritation of the kidney; the pain in the left arm, which is often coincident with disease of the heart, &c. Persons suffering from debility, anæmia, and a gouty or rheumatic constitution, are so especially liable to neuralgia, that these conditions—as also exposure to malarious influences—must be placed among the predisposing causes. Amongst the exciting causes, exposure to cold and wet, or to a cold dry east wind, is the most frequent; but fatigue, strong mental emotions, the abuse of tea, coffee, tobacco, and alcoholic drinks, a wound or bruise, the retrocession of gout, rheumatism, or cutaneous eruptions, &c., occasionally suffice to excite the disease.

The resources of the *materia medica* have been exhausted in searching for remedies for this cruel disease. Dr Elliotson believes that 'in all cases of neuralgia, whether exquisite or not, unaccompanied by inflammation, or evident existing cause, ice is the best remedy;' and there can be no doubt that when the disease is accompanied with debility and paleness, no remedy is likely to be so serviceable. If the digestive organs are out of order, the neuralgia may not unfrequently be removed or alleviated by correcting their unhealthy state. 'Dr Rigby tells us that having suffered in his own person an intense attack of *tic douloureux*, which opium did not assuage, he swallowed some carbonate of soda dissolved in water. The effect was almost immediate; carbonic acid was eructed, and the pain quickly abated. In this case, the pain depended upon the

mere presence of acid in the stomach. More often the cause of offence appears to lie in some part of the intestines; and purgatives do good. Sir Charles Bell achieved the cure of a patient upon whom much previous treatment had been expended in vain, by some pills composed of cathartic extract, croton oil, and galbanum. He mixed one or two drops of the croton oil with a drachm of the compound extract of colocynth; and gave five grains of this mass, with ten grains of the compound galbanum pill, at bedtime. Other cases have been since reported, both by Sir Charles and by others, in which the same prescription was followed by the same success.—Watson, *op. cit.* p. 727.

When the disease occurs in a rheumatic person, iodide of potassium (from three to five grains taken in solution three times a day before meals) sometimes gives great relief. When the paroxysms occur periodically—as, for example, with an interval of 24 or 48 hours—sulphate of quinine in doses of from 10 to 20 grains between the paroxysms, will usually effect a cure; and if the disease resist comparatively small doses, the quantity may be increased to half a drachm, or a drachm if necessary. Arsenic acts in the same manner as quinine in these cases, but usually less effectually.

The inhalation of chloroform will sometimes give permanent relief, and always gives temporary ease, and shortens the period of suffering.

The injection of a certain quantity of a solution of muriate of morphia, by means of a sharp-pointed syringe, into the cellular tissue beneath the skin over the painful spot, very often gives immediate relief. For the discovery of this mode of treating neuralgia, we are indebted to Dr Alexander Wood of Edinburgh. At one time—about half a century ago—it was a common practice to divide the trunk of the painful nerve, with the object of cutting off the communication between the painful spot and the brain; but in many instances the operation signally failed, and it is now never resorted to. A much simpler operation, namely, the extraction of a canine tooth, has often been found to give permanent relief in cases of facial neuralgia, and in such case a careful examination of the teeth should usually be made.

Local applications can be of no permanent service in cases where the pain results from organic change, or from general constitutional causes; they will, however, often give considerable temporary relief. Amongst the most important local applications may be mentioned laudanum, tincture of aconite (or aconitina ointment, in the proportion of one or two grains to a drachm of simple ointment or cerate), belladonna-plaster, and chloroform (which should be applied upon a piece of linen saturated with it, and covered with oiled silk, to prevent evaporation).

Lastly, neuralgia being a purely nervous affection, is often influenced by means calculated to make a strong impression on the mind of the patient; and hence it is that galvanic rings, electric chains, mesmeric passes, homœopathic globules, and other applications, which, like these, act more upon the mind than upon the body of the patient, occasionally effect a cure.

NEURITIS is the term applied to inflammation of the nerves. The disease is rare, and not very well defined. The symptoms closely resemble those of neuralgia. Rheumatism seems, in most cases, to be the cause of the disease, which must be treated by bleeding, leeching, purging, and low diet. Anodynes are also required for the relief of the pain; and of these, Dover's Powder, in tolerably full doses, is perhaps the best.

NEUROPTERA (Gr. nerve-winged), an order of

mandibulate insects, having four nearly equal and membranous wings, all adapted for flight, divided by their nervures into a delicate net-work of little spaces, and not covered with fine scales, as in the *Lepidoptera*. The wings are often extended horizontally when at rest, nearly as in flight; but the position is various. The form of the wing is generally somewhat elongated. The body is generally much elongated, particularly the abdomen. The head is often large, the compound eyes very large, and there are often also simple or stemmatic eyes. The habits are predaceous, at least in the larva state; often also in the pupa and perfect states, the food consisting of other insects, often caught on the wing. The power of flight is accordingly great in many. The larvæ and pupæ are often aquatic. The females have no sting, and only a few have an ovipositor. The metamorphosis is complete in some, incomplete in others. Dragon-flies, May-flies, scorpion-flies, ant-lions, and termites, or white ants, belong to this order.

NEUSATZ (also *Neoplanta* or *Uj-Videk*), a town of the Austrian empire, in the Servian Wojwodschafft, is situated on the left bank of the Danube, opposite Peterwardein. Its origin dates from the year 1700, and in the year 1849 it numbered nearly 20,000 inhabitants. A bridge, 840 feet in length, extends between N. and the town and fortress of Peterwardein. N. is the seat of the Greek non-united Bishop of Bács. On the 11th June 1849, it was taken from the Hungarian insurgents by the imperial troops, and was almost wholly destroyed. It has been rebuilt in excellent style. N. is a station for steamers on the Danube, and carries on an important and active trade. Pop. 19,119.

NEUSE, a river of North Carolina, United States of America, rises near the middle of the northern boundary of the state, and, after a south-easterly course of 250 miles, falls by a broad channel into Pamlico Sound, which communicates by several inlets with the Atlantic Ocean. It forms the harbour of Newbern.

NEUSIEDL, LAKE (Hung. *Ferto-tava*), a small lake on the north-west frontier of Hungary, 22 miles south-east of Vienna. It is 23 miles in length, and about 6 miles in average breadth, with a mean depth of 13 feet. Its waters are light-green in appearance, and are brackish in taste. The slopes of the Leitha Mountains in the vicinity produce excellent wine.

NEUSOHL (Hung. *Besztércze-Bánya*), a beautiful and thriving town of Hungary, the chief place of the richest mining district in the country, is situated in a hill-enclosed valley on the right bank of the Gran, about 85 miles north of Pesth. N., consisting, as it does of the town proper and five suburbs, contains a population, in all, of upwards of 11,780, who are employed in the copper and iron mines of the vicinity, in the smelting-houses, and in the manufacture of beet-root sugar, paper, colours, &c. It is the seat of a bishop, and contains a beautiful cathedral, a bishop's palace, and two evangelical churches, and several other handsome edifices.

NEUSS, a fortress and flourishing manufacturing town of Rhenish Prussia, near the left bank of the Rhine, with which it is connected by the river Erft, 4 miles south-west of Düsseldorf. Its church of St Quirinus, a beautiful edifice, and a notable specimen of the transition from the round to the pointed style, is supposed to have been built in 1209. N. is the principal grain-market of the province, and carries on manufactures of woollen and other cloths, ribbons, hats, vinegar, &c. It is supposed to be

Landenberg, now a military academy for the preparatory instruction of officers of the line. It accommodates from 400 to 500 pupils. The castle contains a fine Gothic chapel (date, 1460), rich in painted windows. It is the burial-place of the Emperor Maximilian I. On the 14th September 1834, the whole town, with the exception of fourteen houses, was destroyed by a dreadful conflagration, which involved the loss of many lives. The new town has been laid out with great taste and regularity. The canal (40 miles in length) and the railway to Vienna, and the converging roads from Styria and Hungary, are the sources of the prosperity of the town. In N. machinery is extensively constructed; and sugar-refining and manufactures of silk, velvet, and cotton fabrics, fayence, leather, &c., are carried on. Pop. 18,070.

**NEUSTADT AN DER HARDT**, a small town of Rhenish Bavaria, charmingly situated on the Speyerbach, at the foot of the Hardt Mountains, 12 miles north of Landau. Its church, with several curious monuments of the Counts Palatine, and with some ancient fresco-paintings, was finished in the 14th century. It carries on some manufactures, together with the brewing of beer. Pop. 9320.

**NEU-STADT-E-BERSWALDÉ**, a town of Prussia, in the province of Brandenburg, in a pleasant district on the Finow Canal, 28 miles north-east of Berlin, on the Berlin and Stettin Railway. It is well known on account of its mineral springs, and carries on extensive manufactures in steel, iron, copper, brass, paper, and porcelain. Pop. 8044.

**NEU-STADTL AN DER WAAG**, a town near the north-west frontier of Hungary, 33 miles north-north-west of Neutra. Here excellent red wine is grown, and there is a good trade in grain, wool, sheep-skins, and wax. Pop. 5451, nearly half of whom are Jews.

**NEU-STRELITZ**, the capital and the residence of the court of the grand duchy of Mecklenburg-Strelitz, pleasantly situated in a hilly district, between two lakes, 60 miles north-north-west of Berlin. It was founded in 1733, is built in the form of an eight-rayed star, and contains the ducal palace, with a library of 70,000 vols., and having magnificent gardens attached. Pop. (1871) 8470, supported chiefly from the expenditure of the court, and by

the ratio of the resistance to extension were the same for all substances depended merely on the form of the bodies of the same form the neutral have a definite geometrical position; but satisfactorily proved, by Mr Eaton that this ratio has a separate value for each substance. In wood, where the ratio is one, the neutral axis in a beam supported at whose section is rectangular, passes through the centre of the beam; while in which the resistance to compression is more than that to extension, it is a little above the centre of the beam; in wrought iron, in which the contrary is the case, it is a little below the centre.

#### NEUTRAL SALTS. See SALTS.

**NEUTRALS**, nations who, when a war is carried on, take no part in the contest, and have no particular friendship for, or hostility to, the belligerents. As a general rule, neutrals conduct themselves with perfect impartiality, and do nothing which can be considered as favouring one belligerent more than another.

The duties and obligations of neutrals have given rise to many complicated questions, and are allowed on all hands that a neutral state has a right to her character of neutrality by furnishing no aid to either belligerent any of the articles that come under the denomination of Contraband of War. If she does so, the other belligerent is warranted in intercepting the succours, and confiscating the contraband as lawful prize. Contraband of war, besides arms and munitions, has sometimes been held to include other articles, a supply of which is necessary for the prosecution of the war; and it has been held, in some circumstances, that corn, hay, &c., may not come under that category.

An important question regarding neutrals is, whether enemies' goods not taken in war may be lawfully conveyed in neutral ships. The principle that free ships make free goods has long resisted by this and other maritime powers, and the general understanding has been that belligerents have a right of visiting and searching neutral vessels for the purpose of ascertaining whether the ship is really neutral, as the display of a neutral flag affords no absolute security. It is so; 2d, whether it has contraband

## NEUWIED—NEW BEDFORD.

of war, it has been said that the declaration of the officer in command of the convoy that there is no contraband of war or belligerent property on board, is sufficient to bar the exercise of the right of search.

A declaration having important bearings on the rights of neutrals, was adopted by the plenipotentiaries of Great Britain, Austria, France, Prussia, Russia, Sardinia, and Turkey, assembled in congress at Paris, on April 16, 1856. By its provisions, 1. Privateering is abolished. 2. A neutral flag covers enemies' goods, with the exception of contraband of war. 3. Neutral goods, with the exception of contraband of war, are not liable to capture under the enemy's flag. 4. Blockades, in order to be binding, must be effective, that is, maintained by a force sufficient really to prevent access to the coast of the enemy.

It has sometimes been proposed to exempt private property at sea from attack during war—such a project, however, seems inexpedient. There may be a propriety in respecting the property of individuals on land, in a time of war, because its destruction, however injurious to the persons immediately concerned, can have little influence on the decision of the contest. But at sea, private property is destroyed because those from whom it is taken, being purveyors or carriers for the community at large, its loss must seriously affect the public, and have no small influence in bringing the contest to an end. See **BLOCKADE, PRIVATEER.**

**NEUWIED**, a town of Rhenish Prussia, on the right bank of the Rhine, 8 miles below Coblenz. It is the capital of the principality of Wied, now mediatised and attached to Prussia, and is the seat of the princes of Wied, with a beautiful castle. It was founded in the beginning of the 18th c. by Prince Alexander of Wied-Newweid, who, offering perfect toleration in religious matters, as an inducement, invited colonists of whatever persuasion to settle here. The town is well built, with wide, straight streets, running at right angles to each other, and contains the churches of Protestants, Catholics, Jews, Herrnhuters, &c. The inhabitants are well conditioned and industrious. Pop. 8664, who carry on manufactures of hosiery, woollen and cotton fabrics, iron-ware, leather, and tobacco.

**NEVA**, a river of Russia, in the government of St Petersburg, flows westward from the south-west corner of Lake Ladoga to the Bay of Cronstadt, in the Gulf of Finland. Its length, including windings, is about 40 miles, 9 miles of which are within the limits of the city of St Petersburg; and in some places it is 2100 feet broad, and about 56 feet deep; although at Schlussemburg, where it issues from the lake, and at St Petersburg, where it enters the sea by several branches, it is shallow. From Cronstadt, goods are brought to St Petersburg in lighters or in small steamers. By the Ladoga Canal, the N. communicates with the vast water-system of the Volga, and thus it may be said to join the Baltic with the Caspian Sea. Its current is very rapid, and the volume of its waters is immense. It is covered by drift-ice for upwards of five months—from about the 25th November to the 27th April. An extensive traffic is carried on on its waters, both from the interior and from the Baltic.

**NEVADA**, one of the states of North America, is bound on the W. by California; on the S. by California and Arizona; on the E. by Utah and Arizona; and on the N. by Oregon and Idaho. Lat. 35°—42° N.; long. 114°—120° W. Area, 112,090 square miles. Pop. (1870) 42,491, of whom 38,959 were white, 357 coloured, and 3152 were Chinese.

The chief river is the Humboldt. The principal lakes are the Mud Lakes, Pyramid Lakes, and the Walker and Carson Lakes. N. is the centre of that elevated basin which reaches westward from the Rocky Mountains to the Sierra Nevada, at a mean altitude of about 4000 feet above the level of the sea. Numerous mines, either of gold or silver, have been discovered. The whole country is rich in mineral wealth. Besides gold and silver, quicksilver, lead, and antimony are found. The territorial capital is Carson City (pop. 3042), but the principal town is Virginia City (pop. 7048). The product of silver in N. during the decade 1859—1869 was valued at 137,382,000 dollars; for the latter year its value was about 14,000,000 dollars.

**NEVERS**, a town of France, capital of the department of Nièvre, and formerly the capital of the province of Nivernais, is built on a hill in the midst of fertile plains, at the confluence of the Loire and the Nièvre, 140 miles south-south-east of Paris. Highly picturesque, as seen from a distance, its interior shews steep, winding, and badly paved streets. It contains a beautiful cathedral of the 10th c., and a fine public garden; the large cavalry barrack, the fine bridge of 20 arches over the Loire, and the triumphal arch, erected in 1746, to commemorate the battle of Fontenoy, are also worthy of mention. N. is the see of a bishop, contains a public library, and has numerous educational, scientific, and benevolent institutions, and an arsenal. There is here an important cannon-foundry, and the principal manufactures are porcelain and earthenware, glass, brandy, iron cables and chains, and anvils. Pop. (1872) 19,314.

N., the *Noviodunum* of the Romans, existed prior to the invasion of Gaul by Julius Caesar. It has been the seat of a bishop since the beginning of the 6th c., when it was called *Nevirum*, became a county in the 10th c., and was erected into a duchy by Francis I. in 1538.

**NEVILLE'S CROSS.** See **BRUCE, DAVID.**

**NEVIS**, a small island of the West Indies, belonging to Great Britain, forms one of the group of the Lesser Antilles, and lies immediately south-east of St Christopher's, from which it is separated by a strait called the *Narrows*, two miles wide. It is circular in form, rises in a central peak to the height of about 2500 feet, and has an area of 20 square miles. Pop. (1871) 11,735, of whom very few are white. Charlestown, a seaport, with a tolerable roadstead, situated on the south-west shore of the island, is the seat of government, consisting of a government council and general assembly. The soil is fertile, and the principal products are sugar, molasses, and rum. In 1870, the revenue of N. was £8830; and the expenditure, £6404. The imports for the same year were valued at £54,286; and the exports, at £64,119. The product of sugar was 2725 hogsheads, 160 tierces, and 7690 barrels; of molasses, 1618 puncheons. There was no rum reported in 1870; and in 1869, the product was only 2 puncheons. There are 15 schools on the island.

**NEW ALBANY**, a town in Indiana, U. S., on the north bank of the Ohio River, at the foot of the falls, opposite Portland, and 2 miles below Louisville, Kentucky; a finely situated, well-built town, having 22 miles of streets, 6 ship-yards, 6 foundries, 22 churches, and is the site of Asbury College and a collegiate institute. It has a large river-trade and railway connections with Indiana and Kentucky. Pop. (1870) 15,396.

**NEW BEDFORD**, a seaport city of Massachusetts, U. S., on Buzzard's Bay, 55 miles south of Boston. Since 1755, it has been the chief centre of

## NEW HARMONY—NEW JERSEY.

cap-stone. The soil, except in the fertile valleys, is better adapted to pasturage than culture. The winters are long and cold, so that in the mountainous regions mercury sometimes freezes. In the forests are oak, maple, pine, hemlock, spruce, &c. The chief agricultural products are maize, rye, oats, apples, potatoes, and products of the dairy. Numerous waterfalls give motive-power to many cotton factories, woollen, iron, and paper mills, &c. The state has 734 miles of railway, 51 banks, 2 colleges, one at Dartmouth, 700 churches, 38 newspapers, an excellent system of free schools, and government and judiciary similar to all the American states. N. H. was settled in 1623 by colonists from Hampshire in England, who suffered during the colonial period from Indian wars and depredations. The state was organised in 1776. It has furnished a multitude of migrants to the newer and more fertile western states. Pop. in 1810, 214,360; in 1840, 284,574; in 1860, 326,072; in 1870, 318,300.

**NEW HARMONY**, a village of Indiana, first settled in 1815 by a German community of religious socialists, called Harmonists, under the leadership of George Rapp. In 1824, the village and domain was purchased by Robert Owen, for an experimental community on his system. After the speedy failure of this society, the property was bought by William Maclure for a School of Industry. It is now a flourishing western village, of (1870) 836 inhabitants.

**NEW HAVEN**, the chief city, seaport, and semi-capital of Connecticut, U. S., at the head of Long Island Sound, 4 miles from Long Island Sound, 76 miles east-north-east of New York. Its broad streets are lined with elms, and the public squares, parks, and gardens, with its handsome public and private edifices, make it one of the most beautiful of American cities. It is the seat of Yale College (q. v.), which has 8 large buildings and a Gothic library, 10 feet long. There are a handsome custom-house, state-house, hospital, 32 churches, academies and schools, 8 banks, 4 daily papers, and 3 ornamental cemeteries. There are large manufactories of carriages, clocks, and leather, iron and india-rubber works. A railway and steam-boats connect it with New York and the New England towns. Pop. (1870) 18,540.

**NEW HEBRIDES**, a group of islands situated in the Pacific Ocean, to the north-east of New Caledonia, and to the west of the Fijis, extending S. lat. between 14° and 20°, and in E. long. between 167° and 170°. Total area estimated at 600 square miles. They are regarded as the most easterly point of the western division of Polynesia. The group embraces Espiritu Santo (65 miles long by 20 broad), Mallicollo (60 miles long by 28 broad), Uti Ambrym, Annatom, Erromango, Tanna, with an active volcano, and Aurora. Most of the group is hilly and well-wooded, some even mountainous. The most important woods are ebony and sandal; the principal edible products, yams, bananas, cucumbers, cocoa-nuts, and sweet potatoes; and the only animal of consequence, a diminutive species of hog, which, when full-grown, is no bigger than a rabbit. The inhabitants, who number about 200,000, are fierce, but excessively dirty and unintelligent. Erromango is a well-known name in missionary history, being the scene of the barbarous massacre of the Rev. John Williams—generally called the Martyr of Erromango.

**NEW HOLLAND**, the former name for Australia (q. v.).

**NEW INN HALL, OXFORD.** This Hall, with certain gardens adjoining, was presented to the crown and fellows of New College, by William of

Wykeham in 1392. The first principal on record occurs in 1438. During the Civil War it was used as a mint for Charles I. It was restored to the purposes of instruction by Dr Cramer, the late principal, who erected a handsome building for the use of the students.

**NEW IRELAND**, a long narrow island in the Pacific Ocean, lying to the north-east of New Britain (q. v.), from which it is separated by St George's Channel; lat. 2° 40'—4° 52' S., long. 150° 30'—152° 50' E. Length about 200 miles; average breadth, 12 miles. The hills rise to a height of from 1500 to 2000 feet, and are richly wooded. The principal trees are cocoas on the coast, and in the interior forests of areca-palm. The chief products are sugar-cane, bananas, yams, cocoa-nuts. Dogs, pigs, and turtles abound. The natives are apparently of the same race as the inhabitants of Australia; but our information about them is extremely scanty.

**NEW JERSEY**, one of the original thirteen U. S., in lat. 38° 53'—41° 21' N., and long. 73° 58'—75° 29' W., 168 miles long, with a breadth which varies from 59 to 32 miles, containing an area of 7576 square miles, or 4,848,640 acres; bounded N. by New York, E. by the Hudson River and the Atlantic Ocean, S. by the Ocean and Delaware Bay, and W. by Delaware Bay and River, which separate it from Delaware and Pennsylvania. It has 21 counties. The chief towns are Trenton, the capital, Newark, Patterson, Jersey City, New Brunswick. Its coast-line is 120 miles, or, including bays, 540 miles. Besides its bordering rivers, the Hudson and Delaware, its principal streams are the Passaic, Hackensack, and Raritan. The northern portion of the state is hilly and mountainous. The Palisades, a wall of perpendicular trap-rocks, from 200 to 500 feet high, form the western bank of the Hudson River for fifteen miles, and one of the grandest features of its scenery. The central portion of the state is a rolling country, and the southern and eastern portion a sandy plain declining to the sea. Five geological belts cross the state, containing a sandy pine plain with bog iron ore, shelly marls used for manure, glass sand, green-sand or marl, plastic clay, used in making firebricks, metamorphic rocks, argillaceous red sandstone, copper ores, gneiss with specular and magnetic iron ores, red oxide of zinc, and Franklinitic iron. Among the most attractive features in the scenery are the Falls of the Passaic, the Delaware Water Gap, and Schooley's Mountain. Atlantic City, a bathing-place on the sea-coast, connected by railway with Philadelphia, is a fashionable summer resort. The climate is mild, the soil north of the pine plains fertile, the country healthy, except the malarious river-bottoms. The agricultural products of the state are wheat, maize, oats, common and sweet potatoes, apples, peaches, plums, grapes, melons, and garden vegetables for the great neighbouring markets of New York and Philadelphia. There are cotton and woollen factories, iron-works, extensive manufactories of machinery, locomotives, carriages, glass, boots and shoes, &c. The state draws a large revenue from 1091 miles of railway, and several important canals, connecting New York and the coal regions of Pennsylvania. There are 6 colleges, normal and free schools, numerous churches, periodicals, and daily papers. The government is similar to those of all the states.

N. J. was settled in 1620 by Dutch and Swedes. Taken by the English, it was ceded by Charles II. to the Duke of York; it was retaken by the Dutch in 1673, and afterwards bought by William Penn and other Friends, who have here numerous descendants. It was the scene of some of the most

## NEW ROSS—NEW SOUTH WALES.

these names; and the contained fossils of each group were found to be so remarkably different, that the one period was referred to the Palaeozoic series under the name Permian (q. v.), while the other, known as the Trias (q. v.), was determined to belong to the Secondary series.

**NEW ROSS**, a seaport and parliamentary borough of Ireland, situated on the estuary of the Barrow, partly in the county of Kilkenny, but chiefly in that of Wexford, distant 84 miles south-south-west from Dublin. It is an ancient town, having been surrounded by walls about the middle of the 13th century. Before the union, it returned two members to parliament, of whom one was withdrawn by the Act of Union. It is now a place of considerable commerce, and the modern part of the town on the Wexford side is built with great regularity and taste. On the Kilkenny side is a straggling suburb called Rosbercon, connected with N. R. by a metal bridge, erected at a cost of £50,137, which has a swivel-pillar in the centre, to allow vessels to pass: formerly, the connection was by a wooden bridge, nearly 700 feet in length. The port is approachable at spring-tides by ships of 800 tons, and at all times by vessels of 600 tons; and there is a communication by river and canal with Dublin, and also with Limerick. The town is managed by a board of twenty-one commissioners. It possesses no manufactures of any importance. Pop. in 1871, 6813.

**NEW RUSSIA.** See **RUSSIA**.

**NEW SHOREHAM** See **SHOREHAM**.

**NEW SIBERIA**, a group of islands in the Arctic Ocean, lying north-north-east of the mouth of the River Lena, in Eastern Siberia. Lat. 73° 20'—76° 12' N., long. 135° 20'—150° 20' E.; area, 20,480 square miles. The principal are Kotelnoi (the largest), Liakov, Fadievskoi, and New Siberia. The coasts are in general rocky, and are covered all the year round with snow. The islands are very important, on account of the immense multitude of bones and teeth of mammoths, rhinoceroses, buffaloes, &c., which are found in the soil. They are now uninhabited, but there are traces of former inhabitants. Neither bush nor tree is to be seen anywhere.

**NEW SOUTH WALES**, a British colony in the south-east of Australia. It originally comprised all the Australian settlements east of the 135th meridian, but the formation, successively, of the separate colonies of South Australia (1836), Victoria (1851), and Queensland (1859), has reduced it to more moderate dimensions. It is now bounded on the N. by a line which, beginning at Point Danger, in lat. 28° 8' S., follows several lines of heights across the Dividing Range till it meets the 29th parallel, which forms the rest of the boundary westward; on the W. by the 141st meridian; on the E. by the Pacific Ocean; and the line separating it from Victoria on the S. runs from Cape Howe, at the south-east of the island, north-west to the source of the Murray (q. v.), and then along that stream, in a direction west by north, to the western boundary of the two colonies. Area, 323,437 sq. m., or somewhat less than four times that of the island of Great Britain; pop. (1871) 503,981, of whom 275,551 were males, and 228,430 females. The more general physical character of the country is described under the head of **AUSTRALIA**. Within the colony of N. S. W. the mountain-range, which girdles nearly the whole island, is most continuous and elevated, and is known as the Dividing Range. The section of this mountain system on the southern boundary of the colony, called the Australian Alps, rises in Mount

Kosciusko to 7308 feet. From this the range extends northward, the water-shed being from 50 to 150 miles distant from the east coast, and thus divides the colony into two slopes, with two distinct water-systems. The rivers on the eastern side descend with great rapidity, and in oblique tortuous courses, their channels often forming deep ravines. Many of them are navigable in their lower course for sea-going steamers. The principal are the Richmond, Clarence, M'Leay, Manning, Hunter, Hawkesbury, and Shoalhaven. The Hunter River, about 60 miles north of Sydney, opens up one of the most fertile and delightful districts in the country. The Dividing Range, which, opposite to Sydney, is called the Blue Mountains, being singularly abrupt and rugged, and full of frightful chasms, long presented an impenetrable barrier to the west, and kept the colonists shut in between it and the sea, and utterly ignorant of what lay beyond. At last, in 1813, when the cattle were likely to perish in one of those long droughts that appear to visit this country at intervals of a dozen years, three adventurous individuals scaled the formidable barrier, and discovered those downs on the western slope which now form the great sheep-ranges of Australia. A practicable line of road was immediately constructed by convict labour, and the tide of occupation entered on the new and limitless expanse. The numerous streams that rise on the west side of the water-shed within the colony, all converge and empty their waters into the sea through one channel within the colony of South Australia. The southern and main branch of this great river-system is the Murray. The other great trunks of the system are the Murrumbidgee, which is navigable; the Lachlan, at times reduced to a string of ponds; and the Darling. The Macquarie, passing through the rich district of Bathurst (q. v.), is a large tributary of the Darling, but it reaches it only in the rainy seasons. The coast-line from Cape Howe to Point Danger is upwards of 700 miles long, and presents numerous good harbours formed by the estuaries of the rivers. Owing to the great extent of the colony, stretching as it does over eleven degrees of latitude, the climate is very various. In the northern districts, which are the warmest, the climate is tropical, the summer heat occasionally rising in inland districts to 120°, while on the high table-lands, weeks of severe frost are sometimes experienced. At Sydney, the mean temperature of the year is about 65°. The mean heat of summer, which lasts here from the beginning of December to the end of February, is about 80°, but it is much modified on the coast by the refreshing sea-breeze. The annual fall of rain is about 50 inches. Rain sometimes descends in continuous torrents, and causes the rivers to rise to an extraordinary height. Sometimes the rains almost fail for two or three years in succession (see **AUSTRALIA**). The coast, for 300 m. from the northern boundary, is adapted for growing cotton, and in 1868, when a large quantity was grown, the average produce was 180 lbs. per acre; but cotton-planting seems now to be declining. Further south, the climate is more temperate, and is fitted to produce all the grain products of Europe. Immense tracts of land, admirably adapted for agriculture, occur in the south-western interior; while in the south-east coast districts, the soil is celebrated for its richness and fertility. In the north, the cotton and tobacco plants, the vine, and sugar-cane are grown, and pine-apples, bananas, guavas, lemons, citrons, and other tropical fruits are produced. In the cooler regions of the south, peaches, apricots, nectarines, oranges, grapes, pears, pomegranates, melons, and all the British fruits, are grown in perfection, and sometimes in such abundance that

# NEW-YEAR'S DAY—NEW YORK.

festive celebration; and, on the contrary, directed that the Christian year should be opened with a day of prayer, fasting, and humiliation. The mandate, however, was but partially observed. The festive character of the day, generally speaking, was pertinaciously preserved, but the day was also observed as a day of prayer; and this character was the more readily attached to it when the year began with the 1st of January, as that day, being the eighth after the nativity of our Lord, was held to be the commemoration of his circumcision (Luke ii. 21).

The social observances of the first day of the New Year appear to have been in substance the same in all ages. From the earliest recorded celebration, we find notice of feasting and the interchange of presents as usages of the day. Suetonius alludes to the bringing of presents to the capital; and Tacitus makes a similar reference to the practice of giving and receiving New-Year's gifts. This custom was continued by the Christian kingdoms into which the Western Empire was divided. In England we find many examples of it, even as a part of the public expenditure of the court, so far down as the reign of Charles II.; and, as all our antiquarian writers mention, the custom of interchanging presents was common in all classes of society. In France and England it still subsists, although eclipsed in the latter country by the still more popular practice of Christmas gifts. In many countries, the night of New-Year's Eve, 'St Sylvester's Eve,' was celebrated with great festivity, which was prolonged till after 12 o'clock, when the New Year was ushered in with congratulations, complimentary visits, and mutual wishes for a happy New Year. This is an ancient Scottish custom, which also prevails in many parts of Germany, where the form of wish—'Prosit' (for the Lat. *prosit*)—Neu-jahr'—'May the New Year be happy'—sufficiently attests the antiquity of the custom. In many places the practice of tolling bells at midnight, and thus 'ringing in the New Year' is still observed. Many religious communions are wont to celebrate it with a special service. In the Roman Catholic Church, the *Te Deum* is still sung at the close of the old year; and New-Year's Day is a holiday of strict obligation.

NEW YORK, one of the thirteen original states of the United States of America, now the most important in population and wealth, occupies an irregular triangular area from the Atlantic Ocean to the great lakes, lat. 40° 29' 40"—45° 0' 42" N., long. 71° 51'—79° 47' 25" W. The state is 412 miles from east to west, 311 from north to south, with an area of 47,000 square miles, or 30,800,000 acres; bounded N. by Lake Erie, Lake Ontario, the river St Lawrence, and Canada; E. by Lake Champlain, and the states of Vermont, Massachusetts, and Connecticut, and by the Atlantic Ocean; S. by the ocean, New Jersey, and Pennsylvania; W. by Pennsylvania, the Niagara River, and the lakes which make its irregular north-western boundary. The state has 60 counties. Its chief towns are New York City, Albany (the capital), Buffalo, Rochester, Oswego, Troy, Hudson, Syracuse, Utica, &c. Pop. (1870) 4,373,068, of whom 1,000,000 are of foreign birth, 500,000 being Irish, and about 250,000 Germans. N. Y., though resting only one corner upon the Atlantic, has its sea-coast extended by Long Island, Staten Island, &c., to 246 miles; while it has a lake coast of 352 miles, and borders for 281 miles on navigable rivers. The Hudson, broad and deep, with tides flowing 150 miles, joins at Albany a system of canals, which connect New York City with the great western lakes and the river St Lawrence. The state is also traversed by railway-

lines in every direction. The centre is beautified by many picturesque lakes, and its north-eastern portion and the banks of the Hudson by fine mountain scenery. The Blue Ridge of the Alleghenies forms the Highlands, whose peaks rise 1500 feet from the Hudson; north of these, the Katskills rise to a height of 3800 feet, with a large hotel for summer visitors at an elevation of 2000 feet; while Mount Marcy and Mount Anthony, peaks of the Adirondacks, in the wild region west of Lake Champlain, are 5337 and 5000 feet high. The chief rivers, besides the Niagara and St Lawrence, are the Hudson, its chief branch the Mohawk, the Genesee, and the sources of the Delaware, Susquehanna, and Alleghany. Its geology presents a series of older rocks, from the Azoic to the lower members of the Carboniferous. Red sandstone of the Middle Secondary period is found on the borders of New Jersey; drift and boulders are found everywhere; the great Silurian belt passes along the eastern line, and granite with iron occurs in the north-east. There is no coal, but rich beds of marble near New York City; productive salt-springs in the centre of the state, which yielded, in 1869, 8,662,237 bushels; and petroleum and natural gas, enough in some cases to light large villages, in the west. Among the mineral springs, those of Saratoga and Ballston have a wide reputation. The climate, mild on the coast, is cold in the northern counties. The soil, particularly of the western and limestone regions, is very fertile, producing the finest wheat, maize, apples, peaches, melons, grapes, &c., in abundance. In 1870, N. Y. state produced 5,614,205 tons of hay, 12,178,462 bushels of wheat, 35,293,625 of oats, 16,462,825 of maize, 17,558,681 lbs. hops, 6,692,040 lbs. maple-sugar, 22,769,964 lbs. cheese, 10,599,225 lbs. wool. Among the natural curiosities are the Falls of Niagara; of the Genesee, three cascades of 96, 25, and 84 feet in 2½ miles; of the Trenton, which falls 200 feet in 5 cascades; the Taghanic Falls, of 230 feet; and the oft-painted Falls of the Kaaterskill, 175 and 85 feet, in a gorge of the Katskill Mountains. In 1870, there were 36,206 manufacturing establishments, employing 351,800 persons, and a capital of \$366,994,320; and in 1869, 35 railways, extending 4568 miles: the Erie Canal is 350 miles, and the New York canals together 855 miles: 351 banks of issue have a capital of \$124,589,000. In 1870, there were 5474 churches; 11,678 public schools, attended by 719,181 pupils; 274 classical, professional, and technical schools, including 7 universities, 24 colleges, and 189 academies, with an attendance of 43,728 pupils; and 1068 boarding and other schools, with an attendance of 99,113 pupils. In 1870, the expenditure for teachers and scholars was \$9,929,462. The number of paupers supported during the year ending June 1, 1870, was 26,152, at a cost of \$2,661,385. The number of persons convicted of crime during the same period was 5473, of which 2000 were foreign born. There were 835 newspapers and other periodicals—87 daily, 518 weekly, 163 monthly, 19 quarterly; but a large number of these are published in the city of New York, and circulated over the Union. The gross receipts of some of the daily papers exceed one million dollars annually. The number of copies issued annually in the state is 471,741,744, and the circulation 7,561,500.

The earliest explorations of New York by Europeans were in 1609 by Hendrick Hudson, who took possession of the country on the river which bears his name for the Dutch; and by Champlain, a Frenchman, who explored Lake Champlain from Canada. It was possessed by the Iroquois, or Five Nations, and the Algonquins. In 1621, the Dutch made a settlement on Manhattan Island,

## NEW YORK—NEW ZEALAND.

mortality of the city is 1 in 35: intramural interments are forbidden, and large cemeteries have been opened on Long Island. The population in 1870 was 922,531; but, if the neighbouring cities of Jersey and Brooklyn be included, exceeds 1,400,000.

**NEW ZEALAND**, a British colony in the South Pacific Ocean, consists of three islands, two large and one much smaller, and of a number of islets scattered round the coasts. These islands, named respectively North, Middle, and the small Stewart's Island, are situated about 6500 miles west from the coast of South America, and about 1200 miles south-east of Australia. The group is irregular in form, but may be said to extend from the south in a north-north-east direction, and, like the peninsula of Italy, resembles a boot in shape. North Island is 500 miles long, and 200 miles in greatest breadth from east to west; Middle Island is 550 miles long, and 210 miles in greatest breadth; Stewart's Island is triangular in shape, and has an area of about 900 square miles. Area of the three islands about 95,000 square miles. The North is separated from the Middle Island by Cook's Strait, which is 18 miles wide at its eastern end and 90 miles wide at its western end; the Middle is separated from Stewart's Island by Foveaux Strait, which averages about 20 miles in width. The group extends in lat. from 34° 15' to 47° 30' S., and in long. from 166° to 179° E.; being thus almost the antipodes of the British Isles.

**Coast Line.**—Of the entire coast line of about 4000 miles, nearly 1500 miles is formed by the shores of North Island, which are deeply indented, and contain many excellent harbours. Commencing from North Cape, and going south-east round the island, the chief harbours are Mongonui, Wangaroa, the Bay of Islands, Auckland, Mercury, and Tauranga Bays, and the ports of Wellington, Manukau, and Hokianga. On the north and south coasts of Middle Island, which are much broken, the harbours are numerous and excellent; on the eastern coast, the principal harbours are Akaroa, Victoria, and Dunedin. On the coasts of Stewart's Island, there are also good ports.

**Surface.**—The New Zealand Islands are of volcanic origin, and a great portion of the entire area is occupied by mountains, among which are many extinct and a few active volcanoes. In North Island, Mount Ruapahu, the highest summit of the central range, is 9000 feet in height, and is capped with perpetual snow. In the same range is Tongariro, an active volcano, 6000 feet high. A continuous range of mountains runs along the western coast of Middle Island, and assumes the form of table-lands and isolated peaks toward the east. This range rises in Mount Cook to about 14,000 feet. In Southern Island, the greatest elevation is about 3000 feet. In North Island, the mountains are mostly clothed with evergreen forests of luxuriant growth, interspersed with fern-clad ranges, and occasionally with treeless grassy plains; extensive and rich valleys and sheltered dales abound; and in the east of Middle Island there are many expansive plains of rich meadow-land, admirably adapted either for agriculture or cattle-breeding. Water and water-power are found in great abundance in the colony, and the numerous rivers are subject to sudden floods from the melting of the mountain snows. As a rule, however, the streams are short, and are not navigable for more than 50 miles above their mouths. The chief is Waikato River, in North Island, which, issuing from the Taupo Lake (30 miles long by 20 broad), flows in a northern direction for 200 miles, and reaches the sea on the west coast. In Middle Island, the rivers Clutha, Mataura, and Waiau, all flowing south, are

among the chief. Around Lakes Rotomahana and Rotorua are a number of grand and beautiful geysers, which throw up water heated to 2° above the boiling-point. The geology of N. Z. is remarkable in a high degree. The mountains, which are of every variety of outline, are chiefly composed of the lower slate-rocks, intersected with basalt, and mixed with primary sandstone and limestone. Beds of coal and lignite exist, and the former have been to some extent worked.

**Soil, Climate, and Productions.**—Of the whole surface-extent of N. Z. (nearly 70,000,000 acres, little short of the combined area of England and Wales, Scotland, and Ireland), one-fourth is estimated to consist of dense forest tracts, one-half of excellent soil, and the remainder of waste lands, scorice-hills, and rugged mountain regions. Nearly 40,000,000 acres are supposed to be more or less suitable for agriculture and cattle-breeding. The soil, although often clayey, has in the volcanic districts more than a medium fertility; but the luxuriant and semi-tropical vegetation is perhaps as much due to excellence of climate as to richness of soil. Owing to the prevalence of light and easily-worked soils, all agricultural processes are performed with unusual ease. The climate of N. Z. is one of the finest in the world. The country contains few physical sources of disease; the average temperature is remarkably even at all seasons of the year, and the atmosphere is continually agitated and freshened by winds that blow over an immense expanse of ocean. In a word, the climate much resembles that of England, with half the cold of the English winter; while the summer is longer and somewhat warmer, the atmosphere is more breezy and pure, and there are many more fine days throughout the year. In North Island, the mean annual temperature is 57°; in South Island, 52°. The mean temperature of the hottest month at Auckland is 68°, and at Otago 58°; of the coldest month, 51° and 40°. The air is very humid, and the fall of rain is greater than in England, but there are more dry days. All the native trees and plants are evergreens. Forests, shrubberies, and plains are clothed in green throughout the year, the results of which are, that cattle, as a rule, browse on the herbage and shrubs of the open country all the year round, thus saving great expense to the cattle-breeder; and that the operations of reclaiming and cultivating land can be carried on at all seasons. The seasons in N. Z. are the reverse of ours; January is their hottest month, and June the coldest. All the grains, grasses, fruits, and vegetables grown in England are cultivated in this country with perfect success, being excellent in quality and heavy in yield; while, besides these, the vine is cultivated in the open air, and maize, the taro, and the sweet-potato are cultivated to some extent in the sunny valleys of North Island. The entire acreage under crop in N. Z. in 1851 was 29,140; in 1858, it was 141,007; in 1872, 1,129,811; while in 1871 the total acreage fenced was 6,778,773. Of the crops, the principal were wheat, oats, barley, potatoes, and sown grass, which, under ordinary circumstances, are grown to great advantage in New Zealand. Besides a few harmless lizards, a small species of rat is the only indigenous four-footed animal found in either of the great islands. Hawks are numerous. The country is destitute of snakes, and possesses no insect so noxious as the English wasp. The pig, introduced by Cook, runs wild, and the red and fallow deer, the pheasant, partridge, quail, &c., and the commoner domestic animals introduced by colonists, thrive well. In February 1872, there were in the colony 81,028 horses, 436,592 cattle, 9,700,629 sheep, 151,460 pigs,

## NEWEL—NEWFOUNDLAND.

blind, the deaf and dumb, and two orphanages. The Literary and Philosophical Society, the Society of Antiquaries, the Natural History Society, the Mechanics' Institution, and the Institute of Mining Engineers (to which has been recently added a large hall, as a memorial of Nicholas Wood, an engineer of celebrity) successfully cultivate their several fields of labour. A College of Physical Science, with four professorships (geology, experimental philosophy, chemistry, and mathematics), was established in 1871, in connection with the university for Durham; and there is also in N., associated with the same university, a college of medicine.

Lords Stowel, Eldon, and Collingwood, Mark Akenside, and Hutton, the mathematician, were natives of N. Connected with it were Thomas Bewick, the engraver; Robert Morrison, the Chinese scholar; George and Robert Stephenson; and Sir William Armstrong.

**NEWEL**, the central column or spindle formed by the ends of the steps of a circular staircase, and round which the stair winds. In turret-stairs, it is a plain roll; but in Elizabethan and old Scotch castles, there are frequent examples of handsome staircases of this kind with ornamental newels.

**NEWFOUNDLAND**, an island and province of the Dominion of Canada, lies in the Atlantic Ocean, at the mouth of the Gulf of St Lawrence, separated from Labrador on the north by the Straits of Belle Isle (about 12 miles broad), and extending in lat. from 46° 38' to 51° 37' N., and in long. from 52° 44' to 59° 30' W. In shape it resembles an equilateral triangle, of which Cape Bauld on the north, Cape Race on the south-east, and Cape Ray on the south-west, form the angles. It is 370 miles in length, 290 miles in breadth, about 1000 miles in circumference, and has an area of 40,200 square miles. Pop. (1869) 146,000.

The island, as seen from the sea, presents a wild and sterile appearance. Its surface is diversified by mountains, marshes, barrens, ponds, and lakes. The mountains in the Avalon Peninsula (stretching south-east from the main portion of the island, and connected with it by an isthmus of only about three miles in width) rise, in some cases, to 1400 feet above sea-level; while, both here and along the western shore, the height of 1000 feet is frequently reached. The number of the lakes and 'ponds' (the latter name being used indiscriminately for a large or a small lake) is remarkable, and it has been estimated that about one-third of the whole surface is covered with fresh water. The 'barrens' occupy the tops of hills. The coast-line is everywhere deeply indented with bays and estuaries, many of which are spacious enough to contain the whole British navy. Of these inlets, the principal, beginning from the northern extremity of the island, are Hare, White, Notre Dame, Bonavista, Trinity, Conception, St Mary's, Placentia, Fortune, St George's, and St John's Bays. These bays vary in length from 25 to 70 miles, are of great breadth, and are lined—as indeed the whole coast is—with excellent harbours. The rivers, none of which are navigable for any distance, communicate between the lakes of the interior and the shore, and are narrow and winding. The main streams are the Exploit, with its affluent the Great Rattling, and the Humber. The soil is sterile and unproductive, although there is considerable cultivation along the sea-board of the settled districts, limited principally to the south-east coast; and a large portion of the land around St John's (q. v.) is under cultivation. The great body of the people being employed either in the fisheries or in establishments connected with them, little attention used to be paid to the

culture of the soil; but very considerable improvements in this respect have latterly been made by the enterprising islanders. In 1845, the only crops raised were oats and hay; but within recent years, large supplies of grain, vegetable, and garden seeds have been imported; and now about 600,000 bushels of potatoes are produced annually, and turnips, hay, carrots, clover, barley, and oats are cultivated with success. The island is rich in useful minerals, among which are silver, copper, galena, marble, limestone, gypsum, roofing-slate, and coal—the last found only in small quantities. Lead, silver, and copper mines are worked, though mining is still in its infancy here. Trees, of which the chief are the fir, birch, willow, and mountain-ash, flourish and reach their natural size only in the low and fertile districts.

The fisheries are of two kinds—the 'Shore Fishery' and the 'Bank Fishery'; the former comprises the shores and bays of N.; the latter comprises a great tract known as the 'Banks' of N., from 500 to 600 miles in length, and about 200 miles in breadth. The Banks form the greatest submarine plateau known; the depth of the water is from 20 to 108 fathoms, and the most productive 'ground' is said to extend between lat. 42° and 46° N. Great variety of valuable fish is found in the waters around the colony, as the cod, salmon, herring, &c. The principal articles of export are fish—comprising dry cod, herring, and salmon—and cod-oil. Of dry cod, 970,176 quintals, value £810,943, were exported in 1870; 3593 tons of unrefined cod-oil, value £107,813; 404 of refined cod-oil, value £21,068; 4982 of seal-oil, value £176,472; and 265,189 seal-skins, value £55,248. The imports are chiefly provisions, as bread, butter, tea, &c.—cordage and cables, and manufactured goods. The imports and exports for 1870 amounted in value to £1,386,635 and £1,297,974 respectively. The revenue of N. in 1870 was £183,290; the expenditure, £147,844. In that year, the total tonnage of vessels that entered and cleared the ports was 320,506; 307,721 tons being tonnage of British vessels, and 12,785 of foreign vessels.

The seal affords one of the most important fishing interests of Newfoundland. This industry may commence any day from the 25th of February to the 5th of March, according to the winds—a north-east wind blocking up the coast with ice, which the first strong westerly wind clears away. At the beginning of the present century, the seal-fishing was carried on with vessels of from 30 to 40 tons, manned by 8 or 10 men. Vessels of from 70 to 180 tons, manned by from 25 to 90 men, were substituted for these, the most suitable being vessels of from 120 to 140 tons. About 1866, steamers were introduced into the seal-fishing, and they have proved so serviceable that it is probable that this kind of vessel will, by and by, be used exclusively in these fisheries. In proportion to the population of N., its religious institutions are ample, while education is within reach of all classes, government grants to the district schools being liberal.

There are no railways in the island, and its peculiar configuration renders even road-making a matter of great difficulty. There are no roads across the island; they are confined chiefly to the south-eastern and south-western sea-board. There is weekly communication for nine months in the year between N. and Europe. In the colony and connected with it, 400 miles of lines of telegraph have been constructed, and the Atlantic telegraph has its western terminus on this island.

The early history of N. is involved in obscurity. It was discovered, June 24, 1497, in the reign of Henry VII., by John Cabot; and the event is noticed by the following entry in the accounts of the privy-purse expenditure: '1497, Aug. 10. To

hym that found the New Isle, £10.' It was visited by the Portuguese navigator, Gaspar de Cortereal, in 1500; and within two years after that time, regular fisheries had been established on its shores by the Portuguese, Biscayans, and French. In 1578, 400 vessels, of which 50 were English, were engaged in the fishery. Sir Humphrey Gilbert, with his ill-fated expedition, arrived in St John's harbour, August 1583, and formally took possession of the island in the name of Queen Elizabeth. In the return voyage, the expedition was scattered by a storm, and the commander lost. In 1621, Sir George Calvert (afterwards Lord Baltimore) settled in the great peninsula in the south-east, and named it the *Province of Avalon*. The history of the island during the 17th and part of the 18th centuries, is little more than a record of rivalries and feuds between the English and French fishermen; but by the Treaty of Utrecht (1713), the island was ceded wholly to England; the French, however, retaining the privilege of fishing and drying their fish on certain portions of the coast. A governor was appointed in 1728. The present form of government, established in 1855, consists of the governor, a legislative council (appointed by the crown), and a general assembly (elected by the people). The coast of Labrador on the mainland, and the island of Anticosti, have been included, since 1809, within the jurisdiction of the governor of Newfoundland.

**NEWFOUNDLAND DOG**, one of the most sagacious and esteemed of the large kinds of dog. It is said to have been originally derived from Newfoundland, where it is used chiefly as a beast of draught, to convey light loads of wood or provisions, on sledges, over rugged tracks. Multitudes of these dogs, in St John's and elsewhere, are left to shift

Newfoundland Dog.

for themselves during the fishing season; and are again called to service when required by their masters. There are several varieties of N. D., particularly a smooth breed, with rather small head, white and spotted with black, which seems now to be extinct; a very large breed, with broad muzzle, head raised, noble expression, waved or curly hair, very thick and bushy curled tail, black and white colour; and a smaller, almost black breed. Some of the breeds seem to be crossed with hounds and other dogs. The N. D. is remarkable for memory, and for patience and forbearance of temper. It is, however, apt to become irascible in confinement, and will then bite even its master. Some of the most interesting anecdotes of the affection and sagacity of the dog, relate to the Newfoundland Dog. No dog excels it as a water-dog. Its paws are half-webbed. Its power of endurance in swimming is very great.

**NEWGATE**, a celebrated London prison, stands at the western extremity of Newgate Street, opposite the Old Bailey. It is the chief criminal prison in the city and county. The exterior presents high dark stone walls, without windows, and with entrances from the side next the Old Bailey, in front of which public executions take place. The earliest prison here was in the portal of the *new gate* of the city, as early as 1218; and hence the name. About two centuries afterwards, it was rebuilt by the executors of Sir Richard Whittington, whose statue with a cat stood in a niche, till its destruction by the great fire of London in 1666. Shortly after, it was reconstructed, from which time, to 1780, the date of the erection of the present edifice, its condition was, in a sanitary point of view, horrible. Mr Akerman, one of the keepers, in evidence before the House of Commons in 1771, stated, as a proof of this, that in the spring of 1773 the jail distemper, spreading to the adjoining Sessions House, caused the death of 'two of the judges, the lord mayor, and several of the jury and others to the number of sixty persons and upwards.' The place, however, is now kept in the cleanest possible condition. The cells for condemned prisoners are at the north-east corner, next to Newgate Street. The *Newgate Calendar* contains biographical notices of the most notorious murderers, burglars, thieves, and forgers who have been confined within its walls.

**NEWMAN, JOHN HENRY, D.D.**, was born at London, February 21, 1801, and educated at the school of Dr Nicholas, at Ealing, whence he passed in 1816, to Trinity College, Oxford, of which college he became a scholar by competitive examination in 1818. Having graduated in 1820, he was elected Fellow of Oriel College in 1822, where he attracted the notice of Dr Whately, and was by him employed in the preparation for publication of his well-known *Treatise on Logic*, and introduced to the editor of the *Encyclopædia Metropolitana*, to which he became a contributor. He was ordained in 1824; and in the following year, his friend Dr Whately having been appointed head of St Alban's Hall, N. was by him selected as his vice-principal; but on being named tutor in his own college in 1827, as also public examiner, he resigned the vice-principality. In 1828, he was presented to the vicarage of St Mary's Oxford, in which church the sermons which he delivered at a late period had an extraordinary influence in forwarding the religious movement with which his name is permanently associated. At this period, N. was an earnest antagonist of the Roman Catholic Church. He was one of those who transferred their support from Sir Robert Peel to Sir Robert Inglis on occasion of the former's introducing the Roman Catholic Relief Bill; and he was one of the most active in commencing and carrying on the so-called Oxford movement—the great object of which was to counteract as well the Romanism as the dissenting tendencies of the time, by raising and bringing into notice what N. and his friends believed to be the catholic character of the English Church. With this view, he commenced, in 1833, the series known as the *Oxford Tracts*, to which he was himself one of the chief contributors; and in 1838, he also became editor of the *British Critic*, which was an organ of the same views, and in conjunction with Drs Pusey and Keble, of a *Library of Translations from the Greek and Latin Fathers*. He continued the publication of the Tracts up to the 90th Number, which was written by himself, and the tendency of which was so distasteful to the Anglican authorities, that the Heads of Houses at Oxford condemned the Tract, and the Bishop of Oxford called on N. to discontinue the publication—a request with which he at once complied.

# NEWMAN-NEWPORT.

The *British Critic* continued for some time longer to advocate the same opinions; but in 1843 that publication also was discontinued; and N., who had for some time resided at Littlemore, near Oxford, engaged, in company with some of his more youthful adherents, in study and ascetic exercises, thenceforward confined himself chiefly to his Littlemore residence, and eventually, in October 1845, was admitted into the Roman Catholic Church, a step which was immediately followed by the publication of a work on the *Development of Doctrine*, which was intended as an explanation of the process through which the writer's own mind had passed. Soon afterwards, N. repaired to Rome, where, after some preparation, he was admitted to orders in the Roman Catholic Church; and in 1848, on his return to England, he established a branch of the Congregation of the Oratory of St Philip Neri, of which he was himself appointed the superior. In 1852, he was appointed rector of the Catholic University established in Dublin, an office which he held for five years, afterwards returning to Birmingham, where he still resides, and in connection with which he has established a school of higher studies for the youth of the Roman Catholic religion. Dr N., in addition to the large share which he had in the publications already named, is the author of several very important works, written as well before as after his withdrawal from Anglicanism. Of the former period, are his *History of the Arians*, *Prophetic Office of the Church*, *The Church of the Fathers*, an *Essay on Miracles*, a *Translation of the Treatises of St Athanasius*, with many learned Dissertations, and several volumes of sermons. To the latter period belong the *Development of Christian Doctrine*, *Lectures on Catholicism in England*, *Apologia pro Vita Sua*, *Letter to Dr Pusey*, and an *Essay on Assent*. N. is also the author of two works of fiction, *Loss and Gain*, and *Callista*, a classical and Christian story of the 5th c.; and he was the editor, and in part compiler, of a series of *Lives of the English Saints*.

NEWMAN, FRANCIS WILLIAM, brother of the preceding, was born in London in 1805, and educated at the school of Ealing. Thence he passed to Worcester College, Oxford, where he obtained first-class honours in classics and mathematics in 1826, and, in the same year, a fellowship in Balliol College. This fellowship, however, he resigned; and he withdrew from the university in 1830, at the approach of the time for taking the degree of M.A., declining the subscription to the Thirty-nine Articles, which was required from candidates for the degree. After a lengthened tour in the East, he was appointed classical tutor in Bristol College, 1834. In 1840, he accepted a similar professorship in Manchester New College, and, in 1846, his great reputation for scholarship, and his general accomplishments, led to his being appointed to the chair of Latin, in University College, London, which he held till 1863. During all this time, he has not only been an active contributor to numerous literary and scientific periodicals, and to various branches of ancient and modern literature, but has also had a leading part in the controversies on religion, in which he has taken the line directly opposite to that chosen by his elder brother, being no less ardent as a disciple of the extreme rationalistic school than John Henry Newman of the dogmatical. These opinions, and the system founded upon them, form the subject of his well-known work, *Phases of Faith*, or *Passages from the History of my Creed* (1850); and of many essays in the *Westminster, Eclectic*, and other Reviews; but he is also the author of very many separate publications. Of these, several regard the controversy to which we

have referred—as, *Catholic Union*; *Essays Towards a Church of the Future* (1844); *A State Church not Defensible* (1846); *a History of the Hebrew Monarchy* (1847); *The Soul, its Sorrows and Aspirations* (1849). Others are on political or social topics—as, *Radical Reforms, Financial and Organic* (1848); *The Crimes of the House of Hapsburg* (1851); *Lectures on Political Economy* (1857); *Europe of the Near Future* (1871). A large number are devoted to historical, classical, and scientific subjects, the most important of which are *Contrasts of Ancient and Modern History* (1847); *Regal Rome* (1852); translations into 'unrhymed metre' of the *Odes of Horace* (1853), and the *Iliad of Homer* (1856); a treatise on *Difficulties of Elementary Geometry*; *Handbook of Arabic* (1866); *Orthoepy* (1869), &c.

NEWMARKET, a market-town of England, famous for its horse-races, is situated in a valley 13 miles east-north-east of Cambridge, and is partly in the county of that name and partly in Suffolk. It contains many well-built and elegant houses, the residences in many cases of gentlemen who are drawn hither from their interest in the *Turf*. The market-house and the famous Jockey Club are the chief edifices. Malt-making and brewing are carried on to some extent; but the town owes its prosperity to the horse-races, and nearly the half of the population are jockeys, grooms, trainers, or stablemen. The race-course of N., owned partly by the Jockey Club, and partly by the Duke of Rutland, is said to be the finest in the world, and the training-ground bears a similar character for excellence. There are seven race-meetings held here annually. See HORSE-RACING. The population in 1871 was 4534.

NEWPORT, a parliamentary and municipal borough, market-town, and river-port of England, chief town of the Isle of Wight, and situated near the centre of that island, on the Medina, which is navigable up to this point. St Thomas's Church, founded in 1854, on the site of an ancient structure built in the reign of Henry III., is a handsome edifice, and contains a monument erected by Her Majesty in memory of the Princess Elizabeth, daughter of Charles I., who died at Carisbrooke Castle, September 8, 1650. Among the educational establishments of N. is the Free Grammar School, in which frequent meetings and negotiations between Charles I. and the Parliamentary Commissioners took place. About a mile north of N. is Carisbrooke Castle, where the king was confined under the guardianship of Colonel Hammond for twelve months (1647-1648). There are several important institutions in the vicinity, as the Albany Barracks, the House of Industry, and the Parkhurst Prison for juvenile convicts. Manufactures of lace are carried on to some extent. Vessels of considerable tonnage can ascend to the quay at high tides. Pop. (1871) 7956.

NEWPORT, a thriving market-town, parliamentary and municipal borough, and river-port of England, in the county of Monmouth, and 24 miles south-south-west of the town of that name, on the Usk, and about four miles from the mouth of that river. It was anciently the port of the city of Caerleon, about three miles further up the river; but during the present century, it has become a shipping port of considerable importance, being the outlet of the produce of the extensive collieries, and iron and tin works of the neighbourhood. It possesses a number of recently-erected public buildings, has spacious docks, manufactures nails and spikes extensively, exports iron and coal largely, and carries on an excellent general trade. In 1872, 11,612 vessels, of 1,268,519 tons, entered and

## NEWSPAPER.

*The Scots Dove, The Parliament Kite, The Secret Owl, Mercurius Mastix, Mercurius Democritus, Mercurius Acheronticus, or News from Hell, &c.* The arrangement of the news is poor in the extreme, and what few comments there are, are of the most virulent description. The Long Parliament subjected the newspaper press to a censorship, which became more strict under Charles II. The first English newspaper which could properly be considered a vehicle of general information, was the *Public Intelligencer*, established by Sir Roger L'Estrange in 1663; it was dropped on the appearance of *The London Gazette*, the first number of which was published November 7, 1665, at Oxford, where the court was residing in consequence of the plague being then in London. A second paper, called *The Observer*, was afterwards started by L'Estrange, who, in 1680, exercised his authority as licencer of the press by issuing a proclamation 'for suppressing the printing and publishing of unlicensed news-books and pamphlets of news.' Small as was the sheet, a difficulty often arose how to fill it. One publisher was in the way of supplying the dearth of news by a passage from the Bible; another announced that 'blank space is left that any gentleman may write his own private business.'

Up to the reign of Queen Anne, few of the newspapers appeared oftener than once a week. From the interest excited by Marlborough's victories arose a demand for more frequent intelligence, and besides 17 newspapers published three times a week, the *Daily Courant*, established in 1709, was issued every day except Sunday. Of the more noted London newspapers, the *London Daily Post and General Advertiser* was established in 1726, and in 1752 became the *Public Advertiser*; a celebrity attaches to it from having been the medium in which 'Junius's Letters' first appeared. The *St James's Chronicle* arose from an amalgamation of two papers, the *St James's Post* and *St James's Evening Post*, both which began in 1715. The *North Briton*, edited by Wilkes, first appeared in 1762. The *Morning Chronicle*, discontinued in 1862, dates from 1770; the *Morning Post*, from 1772; the now defunct *Morning Herald*, from 1781; the *Times* first appeared in 1788, as a continuation of the *London Daily Universal Register*, established three years earlier.

During the reign of George III. prosecutions were rife against newspaper writers and editors; their result, generally, was to give a greatly increased currency to the doctrines assailed, and to confer a fictitious importance on the traders in politics, by whom many of the journals were conducted. The first attempt at parliamentary reporting was resented by the House of Commons as a breach of privilege, but the resolutions and the imprisonments of 1771 all ended in the tacit concession of publicity of discussion which has ever since prevailed.

The newspapers of Great Britain have, within the present century, greatly increased in size and improved in literary character. In both respects they are far in advance of the journals of any other country. Each number of the *Times* now consists in general of 16 pages, occasionally 24, and contains upwards of 5000 advertisements. The success of the *Times* is mainly due to the enterprise of its original promoter, Mr Walter, who first introduced various improvements in the art of printing, and made a strong effort to secure the best literary talent attainable in all departments of his journal. One of the most notable incidents in the history of the *Times*, was the exposure, through means of its Paris correspondent, of a gigantic scheme of forgery, planned in France in 1840—a scheme which contemplated the almost simultaneous presentation, at the chief

banking-houses of the continent, of forged Letters of Credit from Glyn and Co. The failure of the conspiracy was mainly due to the exertions made by the *Times*. One of the parties implicated, brought an action for libel against the printer, and obtained a verdict of one farthing damages. A public subscription was raised to defray the expenses incurred in defending the action; when the proprietors of the *Times*, declining personally to accept the sum subscribed, invested it in two *Times* scholarships in connection with Christ's Hospital and the City of London School, for the benefit of pupils proceeding thence to Oxford or Cambridge.

The editing of one of the leading London newspapers involves an immense daily expense, and the co-operation of a number of talented writers. The principal editor, as representative of the proprietors, has the whole oversight and responsibility intrusted to him. He occasionally furnishes the leading article, but it is more frequently composed by one of a staff of literary contributors, who are bound on the shortest notice to write on any subject which the editor may assign. The leader is in form a relic of the time when the newspaper was the newsletter; it is its professed object to analyse, condense, and explain public transactions, to scrutinise what is doubtful or suspicious in the conduct of public men, and to expose sophistry and imposture. Under the editor are various sub-editors, having the superintendence respectively of the London, the provincial, the foreign, the literary, the industrial, and other departments. The commercial article is furnished every evening by a contributor in the City. There are twelve to sixteen parliamentary short-hand reporters, who are continually relieving one another, besides reporters attached to the courts of law, and correspondents who furnish accounts of public meetings and local news of various kinds. The foreign intelligence, a most important department in the great London journals, is furnished by correspondents in all parts of the world, some of them, particularly those employed in time of war, being men of very high reputation in the literary world.

A stamp-duty on newspapers was imposed in 1713 by 10 Anne, c. 19, amounting to one halfpenny on 'half a sheet or less,' and one penny 'if larger than half a sheet, and not exceeding a whole sheet.' The duty was raised  $\frac{1}{4}$ d. by 30 Geo. II. c. 19; another halfpenny was added by 16 Geo. III. c. 34; still another by 29 Geo. III. c. 50; and a further addition of  $\frac{1}{4}$ d. was made by 37 Geo. III. c. 90, amounting to  $\frac{3}{4}$ d. in all. Act 6 and 7 Will. IV. c. 76, reduced the stamp-duty to 1d., with the addition of  $\frac{1}{4}$ d. or 1d. when the sheet contained upwards of 1550, or of 2295 square inches on each side. An additional  $\frac{1}{4}$ d. was chargeable on a Supplement. By 18 and 19 Vict. c. 27, passed in 1855, the newspaper stamp was abolished, a change which occasioned an immense increase in the number of newspapers, and diminution of their price, though many of the cheap papers then started were of very brief duration. The repeal of the paper-duty, which took effect on October 1, 1861, also added, though to a much less considerable extent, to the number and cheapness of newspapers. The number of stamps issued on British newspapers was  $7\frac{1}{2}$  millions in 1753, 16 millions in 1800, and 65,741,271 in 1850.

In 1843, the number of newspapers published in London was 79; it is now (1874) about 289. 19 of these are daily papers, 6 of them published in the evening, and two out of the 6 mere reprints of the morning papers, with what news had been received during the day. Of these, the most influential for 30 years back has been the *Times*, established in 1788, of which nearly 70,000 copies are printed

## NEWSPAPER.

in his paper; and a similar result followed, in 1798, to another editor, who made some severe observations on the official conduct of a local magistrate. A censorship, established by Lord Wellesley in 1799, was abolished by the Marquis of Hastings in 1818; but a licence, revocable at pleasure, was required to be taken out by every printer of a newspaper. In 1832, the Indian press consisted of 6 European and 5 native journals. The licensing system was done away with by Lord Metcalfe's law of 1835, a step disapproved of by the East India directors. Lord Metcalfe's law remained in force till the sepoy mutiny, since which event there has been a return to the system of licences. In 1855, from 55 to 60 newspapers were published in the native languages of India.—The first Australian paper was the *Sydney Gazette*, founded in 1803 by George Howe, a Creole of St Kitts. Hobart Town had its journal in 1804, and in 1824 newspapers began to multiply in the Australian colonies. The principal are now the *Sydney Herald*, the *Sydney Mail*, the *Argus* of Melbourne, and the *South Australian Register*. The materials for printing this last-named paper were carried out by the original South Australian colonists, the first number having been previously printed in England. A similar course was adopted by the first New Zealand colony in 1839 in founding their *New Zealand Gazette* and *New Zealand Advertiser*. Tahiti has, since 1844, had its *L'Océanie Française*. There is also the *Fiji Times*, the *Fiji Gazette*, and the *Central Polynesian*.

*France*.—The earliest French newspaper is said to have been established by Théophraste Renaudot, a physician, in the beginning of the 17th century. The first number of his *Gazette* appeared in 1631. In the following year, through interest of Cardinal Richelieu, he obtained a royal privilege for his *Gazette*; it was continued weekly up to 1702, and then began to appear twice in the week, and to combine advertisements with public news. Commercial intelligence was added in 1765, and in 1792, theatrical announcements. In 1650 was started the *Gazette Burlesque*, a journal in verse, edited by the poet Jean Loret, devoted in a great measure to the *chronique scandaleuse* of Paris; and in 1672, the *Mercure Galant*, a political and literary journal, which afterwards became the *Mercure de France*, and was continued during the Revolution, and down to 1815. The first French daily newspaper was the *Journal de Paris*, which began in 1777, and was discontinued in 1819. A large crop of journals sprang into being with the Revolution, organs respectively of Republicans, Jacobins, and Royalists, but most of them had a very brief existence. Under the first Napoleon the freedom of the press was much restricted. By one of his earliest ordinances as First Consul, all the newspapers were suppressed except 13, and under the Empire the tolerated journals were allowed to be little more than echoes of the official *Moniteur*. From the danger which attended the handling of political questions, arose the practice of filling a large portion of the sheet with the 'Feuilleton,' consisting of a sketch or tale by a popular writer, which has ever since been a characteristic of French journalism. During the Restoration period, the press being again less fettered, there was a large increase in the number of newspapers. In 1826, there were 127, and in 1829, 307 newspapers published in Paris. The July Revolution at first added still further to their number; but the restrictive measures of 1834, consisting in the imposition of a stamp-duty, and of an obligation to find security to the amount of 24,000 francs, led to the collapse of a large proportion of the then existing journals. The *Moniteur*, *Débats*, and *Presse* were in possession of the government,

and for a time also the *Constitutionnel*, and every shade of political opinion had its recognised organ. Emile de Girardin's scheme of widening the circulation of the government organ, the *Presse*, by bringing down the subscription price from 80 to 40 francs, had the result of reducing the price of the opposition journals also. Cheap newspapers being thus established, it soon appeared that with the class among whom they circulated most widely the feuilleton was regarded of more importance than the political article, and it thus became the policy of the journalists to pay enormous sums to the cleverest novelists of the day, in order to retain them in their service. 100,000 francs paid by Dr Véron of the *Constitutionnel* to Eugène Sue for his *Juif Errant*, turned out as profitable a speculation for the journalist as for the novelist.

The Revolution of 1848, like the revolutions that had gone before it, gave birth to a multitude of short-lived journals. There were 89 different political journals started into ephemeral existence in Paris during the late Commune, from March 19 to the 27th of May 1871. When the late Emperor Napoleon was president of the republic, a law was passed obliging the author of every newspaper article to affix his name to it. In February 1852, the press laws were incorporated, with increased stringency, into a *Décret organique sur la Presse*. Louis Napoleon, during the empire, relaxed the stringency a little. The republic holds newspapers in as great bondage as did its imperial predecessor. The most important daily papers published in Paris in 1873 are the *République Française*, *Pays*, *Siècle*, *Presse*, *Débats*, *Bien Public*, *France*, *Journal Officiel*, *Charivari*, and *Figaro*.

*Belgium*.—In the Low Countries an illustrated war gazette, called the *Nieuwtedinghe*, was first published in 1605; it was the precursor of the *Gazette van Antwerpen*, which survived till 1805. During the Spanish and Austrian rule, each town had its privileged newspaper, but the press was considerably fettered in the expression of political opinion. Under the French rule, most of these journals disappeared or sunk into insignificance. The *Annales Politiques* was a political journal of considerable popularity during last century. Since the Revolution of 1830, the press has been subject to few restraints, the newspapers have been numerous, and some few of them well conducted. The *Indépendance Belge* has a large circulation, and exercises considerable political influence. It is the property of a company of bankers, and is conducted by a Frenchman of talent and liberal sentiments. The *Moniteur Belge* was instituted as the official organ of the ministry in 1830. The organ of the government is now the *Echo du Parlement*; it is in politics what is there called 'anti-Catholic,' that is, anti-ultramontane. A larger circulation is enjoyed by the *Journal de Bruxelles*, the *Emancipation*, and the *Etoile Belge*; all papers in the interest of the *parti prêtre*, and supplied with correspondence from Rome. The *Précurseur d'Anvers*, and the *Écouteur* of Antwerp, have also a considerable circulation—the latter is at once ultramontane and ultra-democratic.

*Holland*.—The earlier newspapers of Holland were in some respects, particularly in the accuracy of their information, in advance of those of other countries, but gave far more prominence to commercial than to political intelligence. They all bore the name of *Courant* appended to the name of the town where they were published. Though subject to no censorship since 1815, it was not till 1830 that they began to comment on political occurrences. At present the principal Dutch journals are the *Allgemeene Handelsblad* of Amsterdam, and *Amsterdam Courant*; the *Harlemsche Courant*; and

subjects rather than public or political news. The *Journal de St Petersburg*, in French, is the organ of the court, and has considerable circulation out of Russia.

**Turkey.**—The first newspaper in Turkey was founded, in 1795, by M. Verminhac, envoy-extraordinary of the French government to the court of Selim III., and printed in French at Pera. A Frenchman of the name of Blacque established at Smyrna, in 1825, the *Spectateur de L'Orient*, afterwards the *Courrier de Smyrne*, which had considerable political influence during the Greek war. The same M. Blacque afterwards edited the official journal of the Porte, called the *Moniteur Ottoman*, which has, since 1832, been reprinted in Turkish under the name of the *Ta'quimi Vagâi*. The *Ta'quimi* was till lately a very badly printed sheet, but it has much improved, and now issues weekly instead of monthly, sometimes containing very fair literary and political articles. But the most important Turkish paper is the *Djeridei Havadis*, founded in 1843 by Mr Alfred Churchill, an Englishman born in Turkey. It embraces a great variety of matter, a court gazette, official appointments, home and foreign news, advertisements, prices of stocks, and a feuilleton. There are besides in Constantinople two new and popular papers, called the *Terguman Ahval*, or 'Interpreter of Events,' published three times a week, and the *Tas veeri Eshkar*, or 'Mirror of Thoughts,' published twice a week. The latter has a scientific and literary repute. The Turkish papers have no leading articles, and from the constitution of political society in Turkey, there can be no avowed opposition to the policy of the government. The Turkish capital possesses also an Armeno-Turkish paper, printed in the Armenian character; an Arabic; and an Italian paper; as also the *Commerce de Constantinople* and *Courrier de Constantinople* in French.

**Greece.**—Various newspapers in modern Greek appeared at Paris and Vienna before Greece obtained her independence; but the first political journal published in Greece was the *Hellenikê Salpigx*, founded in 1824, and soon followed by the *Hellenika Chronika* and *Hellenikos Telegraphos* in Missolonghi, the *Philos tou nomou* at Hydra, the *Ephemerides Athenaikai* at Athens, and the official *Genikê ephemeristês Hellados* published at Nauplia, with its opponent the *Apollôn*, which afterwards became the *Athênâ*. Most of these papers disappeared in 1833 on the system of sureties being introduced. The *Sôtêr* was established as the government organ in 1833. From fifty to sixty newspapers are now published in Greece, the largest number in Athens, and several in the Ionian Islands. Generally speaking, the Greek papers make no endeavour to lead the parties in the state, but are rather distinguished by a blind subservency to their passions and extravagances.

**United States.**—In America, the earliest newspaper was the *Boston Newsletter*, founded in 1704, insignificant in size and contents, and conducted by John Campbell, the postmaster of the town. A rival to it appeared, in 1719, in the *Boston Gazette*, 'published by authority.' The *Boston Newsletter*, however, thrived in spite of opposition. With the name changed to the *Massachusetts Gazette* and *Boston Newsletter*, it was the support of the British rule against the desire for independence, and ceased to appear when the British troops evacuated Boston. The *New England Courant*, established in 1721, was at first printed by James Franklin, and afterwards edited by his brother the famous statesman. It lasted but six years, but a subsequent newspaper, entitled the *Pennsylvania Gazette*, was started by

Benjamin Franklin in 1729, and continued weekly till 1765. *Edes's Boston Gazette*, begun in 1755, was for a long time the chief organ of the popular party, and conducted with considerable talent; in it appeared John Adams's 'Letters of Novanglus.' The *Massachusetts Spy* was another paper of note on the revolutionary side. After being temporarily removed from Boston to Worcester, and suspended for a couple of years, it was resumed, and is still in existence. At the revolution, the New England colonies possessed 13 newspapers; Pennsylvania, 7; New York, 3; and the middle and southern colonies, 10. All were published weekly. The development of the newspaper trade in 'the States' has kept pace with the advancing prosperity of the country. A daily paper is a prime necessity of life in that 'classic soil of newspapers.' In 1870, more than 5000 newspapers were issued in the United States, with an enormous, but unascertained, aggregate circulation: 43 of these, 24 in New York, and 19 in Philadelphia, send out at each issue 2,150,000 copies. Eighty-five newspapers have a circulation exceeding 20,000 copies each publication, of which 40 are in the city of New York, 13 in Boston, 10 in Philadelphia, 8 in Chicago, and 5 in Cincinnati. Some of the leading papers are conducted at an expense of half a million dollars annually, to secure in return gross receipts double the sum. The Germans publish 260; the Scandinavians, 12; Spaniards, 9; Italians, 4; Welsh, 3; while at San Francisco there is a newspaper printed in Chinese and English. About 275 periodicals, with a supposed aggregate circulation of 65,000,000 copies, are published in the United States. Among the leading newspapers of New York, the order of importance, both as to enterprise and circulation, is the *New York Herald*, the *Tribune*, and the *New York Times*.

The principal religious papers are the *New York Independent*, organ of the Congregationalists; the *New York Observer*, which props the Presbyterian cause; and the Rev. Henry Ward Beecher's *Christian Union*. The Methodists are supported by the *Christian Advocate*; and the Baptists by an *Examiner and Chronicle*.

All the other numerous journals of the American States are, compared with those of New York, accounted provincial, but many are, nevertheless, vigorously conducted. Each county, comprising, on an average, 360 square miles, has generally two or three papers—one being republican, another democratic, and if there is a third, it is probably the organ of some religious or other sect. These papers, sold at a very low price, are, in a great measure, filled with local and quack advertisements. The printer is, in most cases, the editor, and the village lawyer supplies leaders seasoned with coarse and personal invective. Some of them have been successfully started with no larger a capital than £100 of borrowed money.

There is an immense collection of newspapers in the British Museum, which belonged in part to the library of Sir Hans Sloane, in part to that of Dr Charles Burney. See Andrews's *History of British Journalism* (London, 1859). Grant's *The Newspaper Press: its Origin, Progress, and Present Condition* (London, 1871).

**NEWT**, or **EFT** (*Triton*), a genus of batrachians of the family *Salamandridæ*, more aquatic in their habits than the salamander, to which, in form and characters, they are very similar, having an elongated body and tail, and four small weak limbs. The tail is vertically compressed, and a crest is often developed on the back and tail, but the crest is characteristic of the males in the breeding season, and the tail becomes rounded when the animals leave the water, as they often do, particularly in

*Corporum*, and were afterwards more completely unfolded in the great work entitled *Philosophiæ Naturalis Principia Mathematica*, which was finally published about midsummer 1687.

Shortly before the *Principia* was given to the public, N. had been called to take an active part in defending the rights of the university against the illegal encroachments of James II. The conspicuous part which he had taken on that occasion procured him a seat in the Convention Parliament, in which he sat from January 1689 to its dissolution in 1690. In 1696, he was appointed Warden of the Mint, and was afterwards promoted to the office of Master of the Mint in 1699, an office which he held till the end of his life. He again took a seat in parliament, in the year 1701, as the representative of his university. Thus engaged in the public service, he had little time left for mere scientific studies—pursuits which he always held of secondary importance to the public duties in which he was engaged. In the interval of public duty, however, N. shewed that he still retained the scientific power by which his great discoveries had been made. This was shewn in his solution of two celebrated problems proposed, in June 1696, by John Bernoulli, as a challenge to the mathematicians of Europe. A similar mathematical feat is recorded of him so late as 1716, in solving a problem proposed by Leibnitz, for the purpose, as he expressed it, of feeling the pulse of the English analysts. When in parliament, N. recommended the public encouragement of the invention of a method for determining the longitude—the first reward in consequence being gained by John Harrison for his chronometer. He was President of the Royal Society from 1703 till his death, a period of twenty-five years, being each year re-elected. In this position, and enjoying the confidence of Prince George of Denmark, he had much in his power towards the advancement of science; and one of his most important works during this time was the superintendence of the publication of Flamsteed's *Greenwich Observations*—a task, however, not accomplished without much controversy and some bitterness between himself and that astronomer. The controversy between N. and Leibnitz, as to priority of discovery of the differential calculus, or the method of fluxions, was raised rather through the partisanship of jealous friends, than through the anxiety of the philosophers themselves, who were, however, induced to enter into and carry on the dispute with some degree of bitterness and mutual recrimination. The verdict of the impartial historian of science must be, that the methods were invented quite independently, and that, although N. was the first inventor, a greater debt is owing by later analysts to Leibnitz, on account of the superior facility and completeness of his method. The details of these controversies, with all other information of the life of this philosopher, will be found admirably collected in the *Life* by Sir D. Brewster, who writes with not only an intimate acquaintance with N.'s works, but in the possession of all the materials collected in the hands of his family. N. died on 20th March 1727, and his remains received a resting-place in Westminster Abbey, where a monument was erected to his memory in 1731. A magnificent full-length statue of the philosopher, executed by Roubiliac, was erected in 1755 in the antechapel of Trinity College, Cambridge. This work was assisted by a cast of the face taken after death, which is preserved in the university library at Cambridge. In 1699, N. had been elected a foreign associate of the Academy of Sciences, and in 1703, he received the honour of knighthood from Queen Anne. Among the best editions of N.'s principal works are the

quarto edition of the *Optics* (Lond. 1704), and the quarto edition of the *Principia*, published at Cambridge in 1713.

NEWTON, THOMAS, an English prelate of the 18th c., was born at Lichfield, January 1, 1704. He was educated at Westminster School, and afterwards at Trinity College, Cambridge, where he took the degree of M.A. in 1730, in which year also he was ordained priest. After holding several minor preferments, he was made Bishop of Bristol in 1761, and died 14th of February 1782. Without any remarkable merit, N. has, one cannot well say how, succeeded in obtaining a place in literary history. His two productions, whose fortunes have surpassed their deserts, are an edition of *Milton's Paradise Lost* (2 vols. 1749), with a memoir of the poet, and critical and explanatory notes; and *Dissertations on the Prophecies* (3 vols. 1754—1758). Besides these, he wrote occasional sermons, and a host of scriptural dissertations, the theology of which is reckoned not always 'orthodox.'

NEWTON, a township in Massachusetts, United States of America, on Charles River, eight miles west of Boston. It contains two villages, Upper Falls and Lower Falls, with 3 paper-mills, 3 cotton and hosiery factories, a Baptist theological seminary, and 12 churches. Pop. (1870) 12,852.

NEWTON-ABBOT, a market town of England, in the county of Devon, beautifully situated in a vale on the river Lemon, 15 miles south-south-west of Exeter. The portion of the town called Newton-Bushel is on the left side of the stream. It has been undergoing considerable improvements within recent years. William of Orange, after landing at Torbay, in 1688, made his first public declaration here. Pop. (1871) 6082.

NEWTON-IN-MAKERFIELD, a thriving manufacturing and market town of England, in Lancashire, 15 miles west of Manchester, on the Manchester and Liverpool Railway. Two large iron foundries, as well as printing, paper and sugar works, an oil-distillery, and a brick, tile, and pot manufactory are in full operation. There is a beautiful lake in the town, called Newton Mere, which is covered during the summer months with the pleasure-boats of the townspeople. Horse-races are held here in June, and horse and cattle fairs in May and August annually. The election of M.P.'s for South Lancashire takes place in Newton. Cotton and flour mills, iron foundries and glass-works are in operation; and bricks are made. Pop. (1871) 8244.

NEWTON-UPON-AYR, a burgh of barony and parish of Scotland, in the county of Ayr, on the north side of the river Ayr, and united with the town of that name by three bridges. See Ayr. Pop. of burgh, 4677. N. has ship-building docks, roperies, and iron and brass foundries. It exports 100,000 tons of coal annually.

NEWTON'S RINGS. In his investigations of the colours produced by thin plates of any material, solid, fluid, or gaseous, Sir Isaac Newton hit upon the following mode of exhibiting the colours produced by a film of air. He took two lenses, one convexo-plane, its convex side having a radius of 14 feet, the other equi-convex, with the radii of its surfaces 50 feet, and laid the first with its plane surface downwards on the top of the second, thus producing a thin film of air between the lenses; the film being thinnest near the centre, and becoming gradually thicker outwards. On slowly pressing the upper lens against the under one, a number of concentric coloured rings, having the point of contact of the lenses for their centre, appeared, and increased in size when the pressure was increased.

# NIAGARA—NIBBY.

dry flats, covered with dense bush, the haunt of elephants and other large animals.

In 1855, the well-known sportsman and traveller, F. Green, ascended the River Tonka, which flows into the north-west angle of Lake N., as far north as the town of Lebebe, in 18° 11' lat., and then supposed that a communication existed with the waters of Cuanene, a river of the west coast. If such is the case, it would be a curious phenomenon in physical geography, communicating, as we know Lake N. also does, with the Zambezi, a river of the east coast.

NIAGARA, a river of North America, which flows from Lake Erie northwards into Lake Ontario. It is about 36 miles in length, and its descent from the level of the one lake to that of the other is about 334 feet. On issuing from Lake Erie, it is three-quarters of a mile broad; but as it flows on, it becomes several miles wide, making room for a number of islands, the largest of which, Grand Island, is 12 miles long, and from 2 to 7 broad. At the foot of Grand Island, which reaches within 1½ mile of the Falls of N., the river is contracted to a breadth of 2½ miles, and grows narrower as it proceeds. By this, and by the descent in the channel, which is about 60 feet in the mile above the Falls, are produced the swift currents known as the *Rapids*, in which the river, notwithstanding its great depth, is perpetually white with foam. At the Falls, which are 22 miles from Lake Erie, the river is divided by an island containing about 75 acres, called Goat Island; but in consequence of a bend in the channel, by far the larger portion of the water is sent down by the Canadian side. On this side, therefore, is the grander cataract which has been named the *Horseshoe Fall*, but no longer bears the name appropriately, as the precipice has been worn from a curved into a somewhat angular shape. This process of wearing away goes on gradually still, a large projection on the Canadian bank, known as the Table Rock, having partly fallen off in 1863. The Horseshoe Fall is above 600 yards in breadth, and about 154 feet in height. The water is so deep that it retains its green colour for some distance below the brow of the precipice; and it rushes over with such force, that it is thrown about 50 feet from the foot of the cliff. One may thus, having donned an oil-skin dress, enter two or three yards behind the curved sheet of water; but the spray is so blinding, the din so deafening, and the current of air so strong, that it requires a tolerably calm nerve and firm foot. The separation caused by Goat Island leaves a large wall of rock between the Canadian and American Falls, the latter being again divided by an islet at a short distance from Goat Island. This fall is from eight to ten feet higher than the Horseshoe, but only about 220 yards broad. A little above the Fall, the channel is divided by Bath Island, which is connected by bridges with Goat Island and the American shore. A small tower, approached from Goat Island, has been built on a rock over the brow of the Horseshoe Fall; and from this the finest view on the American side may be obtained, the Table Rock on the Canadian side giving the completest view of the entire cataract. The Falls can also be seen from below on both sides, and every facility is given for viewing them from all the best points, while magnificent hotels, Canadian and American, offer their inducements to the tourist to stay till he has received the full influence of the scenery. The river is crossed about 200 or 300 yards below the Falls, where it is 1200 yards broad. The current is lessened for about a mile, but increases again as the channel becomes narrower and the descent greater. Between three and four miles below the Falls, a

stratum of rock runs across the direct course of the river, which, after forming a vast circular basin, with an impassable whirlpool, is forced away at right angles to its old channel. The celebrated wire suspension-bridge for the Great Western Railway, with a road beneath for vehicles and foot-passengers, crosses the river 1½ mile below the Fall; it is 800 feet long, 40 broad, and 200 feet above the surface of the water.

NIAGARA, chief town of Lincoln County, in the Canadian province of Ontario, is situated on Lake Ontario, at the mouth of the river Niagara, and is distant by water from Toronto 36 miles. Burned down in December 1813 by the American General M'Clure on his retreat, it was afterwards rebuilt, and promised to be a flourishing town; but its trade has fallen off within the last few years, and its population has decreased to about 3000.

NIAS, an important island belonging to Holland, lies to the west of Sumatra, in 0° 18' 54"—1° 35' N. lat., and 97°—98° E. long., and has an area of about 1575 square miles. In 1857, when the Dutch took complete possession of the island, the population was reckoned at 170,000. There are several places where ships can anchor and take in provisions, water, &c. On the east coast is the village Nias, and on the west, Silorongang. Little islands and coral reefs lie here and there on the coast, which in some places is steep, while mountain-chains run from the south-east to the north-west. There is a greater breadth of excellent farming-grounds than the population, reduced by internal wars and the exportation of slaves, can properly cultivate. They grow rice, cocoa-nuts, bananas, tobacco, sugar-canes, &c., and annually about 110,000 lbs. of pepper. Cattle and horses have been imported, and they pay great attention to the raising of pigs and fowls. Formerly, about 500 Niassers were carried away annually as slaves to Batavia and other places, and though this traffic has been in a great measure suppressed, it is still to some extent carried on.

The Niassers are of the Malay race, but fairer than the Malays usually are. They are gentle, sober, and peaceful, remarkably ingenious in handicraft, ornamenting their houses with wood-carvings, forging arms, &c. The women labour in the fields, the children weave mats, while the men look after the live-stock, and hunt the deer and wild swine. They worship a superior deity, and fear a powerful one, who pursues them if they do evil. Polygamy is permitted, but is rare. The gift to the bride's family is from 60 to 500 dollars. Divorce is not allowed, and adultery is punished by the death of both parties. Dead bodies are placed in coffins above the ground, and creepers and flowering shrubs planted, which speedily grow up and cover them. Trade is on the increase.—See *Malayan Miscellanies*, vol. ii.; *Het Eiland Nias*, door H. J. Domis; Crawford's *Descriptive Dictionary* (London, 1856); *Tydschrift voor Ned. Indië*, 1854, 1860, &c.

NIBBY, ANTONIO, a Roman archaeologist of high celebrity, was born in 1792. He was one of those who, following in the footsteps of Winckelmann, made an elaborately minute investigation of the remains of antiquity their special study. The first work that made him known was his translation of Pausanias, with antiquarian and critical notes. In 1820, he was appointed Professor of Archaeology in the University of Rome. In the same year appeared his edition of Nardini's *Roma Antica*; and in 1837—1838, his learned and admirable *Analisi Storico-topografico-antiquaria della carta de Contorni di Roma*, to which was added (1838—1840) a description of the city of Rome itself. Among his other writings, may be mentioned his *Le Mura di Roma diseguate*

America, but on the dissolution of the union in 1839, became an independent republic. In 1847—1848, a dispute broke out between N. and Great Britain about the Mosquito Coast, which led to some hostilities, and was only finally settled in 1860. Meanwhile, in 1855, a civil war had broken out between the so-called 'Conservatives' and 'Liberals,' which resulted in the victory of the latter, who were, however, obliged to call in the help of the since notorious Colonel William Walker (see *FILLIBUSTERS*).

By the constitution of 19th August 1858, the republic of N. is governed by a president, who is elected by universal suffrage, and holds office for four years. There are two legislative chambers—the Senate and the House of Representatives. Liberty of speech and of the press exists, but is not absolutely guaranteed. The Roman Catholic religion, however, is the only one *publicly* tolerated, but the services of other religious bodies may be privately performed.

**NICARAGUA, LAKE** (native, *Cocibolca*), a sheet of fresh-water in the republic of the same name, 110 miles long, and from 30 to 50 broad. Its elevation above the Pacific, from which it is separated by a low range of hills—at one point only 48 feet higher than the lake itself—is little more than 100 feet. The principal rivers flowing into it are the Mayales and Malacoloja on the north, and the Frio on the south; the only one flowing out is the San Juan (formerly *Usaquadero*), which unites it with the Caribbean Sea. Its islands are numerous, lying mostly in groups; the principal are Ometepe, Zapatero (uninhabited, but with extensive ruins and monolithic idols), Salentanami, and the Corales, a cluster of several hundred volcanic islets lying round the base of the volcano of Mombacho, in the north-west of the lake. The scenery is surpassingly beautiful, and even grand. Lake N. is also interesting on account of the facilities which it presents for water communication between the Atlantic and Pacific Oceans.

**NICA'STRO**, a town of Southern Italy, in the province of Calabria, is most beautifully situated west of the Apennines, on the margin of the coast plains, and commanding views of the sea, 24 miles south of Cosenza. It is the see of an archbishop. There are hot springs in the vicinity. Pop. stated at 7000 and 10,200.

**NICCOLA PISANO**, a distinguished sculptor of Pisa, to the influence of whose works the rise or restoration of sculpture in connection with Gothic architecture is mainly attributable. There is no record of the date of his birth, but from an inscription on a celebrated fountain in Perugia, designed by him and executed by his son Giovanni, it is evident that he was born at the beginning of the 13th century. His earliest work is supposed to be the 'Deposition' over one of the doors of the façade of the cathedral at Lucca, dated 1233. He worked on the principle of studying nature, modified or corrected by the ideal of antique sculpture; and it is said that he first adopted this principle from the sculpture on an ancient sarcophagus brought from Greece in the ships of Pisa; but though most of the finest specimens of Greek sculpture were not discovered till long after N.'s time, he must have had an opportunity of studying many important remains on the various classic ruins with which Italy abounds. This sculptor's reputation is supported by three important works, which remain and are still admired for their excellence—the pulpit of the baptistery at Pisa, the 'Arca' or shrine of St Dominic for the church of that saint at Bologna, and the pulpit of the cathedral at Siena. The first

of these was finished in 1260, and is reckoned the most elegant pulpit in Italy. It is of white marble, six-sided, supported by seven Corinthian columns, and adorned with five bas-reliefs of subjects from the New Testament. The second work, the 'Arca' of St Dominic, is one of even greater extent. It is composed of six large bas-reliefs, delineating the six principal events in the legend of St Dominic, and is ornamented with statues of our Saviour, the Virgin, and the four doctors of the church. The operculum or lid was added about 200 years afterwards. The subjects on the pulpit at Siena, the third of these works, are the same as those on that at Pisa, with the substitution of the 'Flight into Egypt' and the 'Massacre of the Innocents' for the 'Presentation,' and the enlargement of the concluding composition, the 'Last Judgment.' In these compositions there is great felicity of invention and grouping, truth of expression, and grace in the attitudes and draperies; and in that of the 'Last Judgment' the boldness displayed in the naked figures, twisted and contorted into every imaginable attitude, is wonderful, and evinces the skill with which N. drew on the antique and on nature. But it must be admitted that there is a degree of confusion or overfulness in the grouping, and that the heads of his figures are often large in proportion to the bodies; faults incidental to all early efforts. In this last work, it appears by the contract for its execution, that N. was assisted by his scholars Lapo and Arnolfo, and his son Giovanni; and this accounts for a certain feebleness that may be observed in portions of it. He died at Pisa, in 1276 or 1277, and was buried in the Campo Santo. N.'s influence on art extended widely; his pupils Arnolfo and Lapo executed numerous works at Rome, Siena, and other cities. His son and heir in reputation, though not his equal in talent, Giovanni Pisano, was constantly engaged on works of importance; in Pisa, where the Campo Santo (for he was also an architect) was erected from his designs; in Naples, which he visited on the invitation of Charles I. of Anjou; at Arezzo, where he executed the marble shrine of St Donato for the cathedral; at Orvieto, the bas-reliefs on the *facciata* of the Duomo, by many ascribed to N., being by him; at Pistoja, where he executed the pulpit, &c. The year of his death is not ascertained; it was probably about 1320. After Giovanni's death, the Pisan school split into two principal branches, Florence and Siena; that of Naples may also be reckoned a branch, from the influence exercised over it by Giovanni.—**ANDREA PISANO**, the ablest of Giovanni's pupils, was called to Florence to execute in marble the statues, bas-reliefs, &c., designed by Giotto in ornamenting the cathedral of S. Maria del Fiore, then in course of erection. The talent he displayed soon raised him to a high position and important employment. He executed numerous statues for the façade of the cathedral, and a bronze gate for the baptistery, of very great excellence. This gate still exists, along with the later and still more celebrated gates of Ghiberti. Under the influence of Giotto's genius, he became completely Giottesque in thought and style; and his works bear so distinctly the impress of that master-mind, that the design of many of them, and particularly the baptistery gate, are ascribed to Giotto. He died in 1345, aged 76. See Vasari; *Christian Art*, by Lord Lindsay; Agincourt, *Davies Memoriali Storiche*; Rosini, *Storia*, &c.; Cicognara (tom. i.), *Monumenti Sepolcrali della Toscana*.

**NICCOLINI, GIOVANNI BATISTA**, a distinguished modern poet, was born in 1785, in the vicinity of Pisa, of a noble but impoverished family. N.'s first literary efforts were full of high promise of the classical and antique beauties which characterise

*Homoousion.* (See HOMOOUSIAN.) Its clauses correspond (except in a few verbal details) with those of the modern formulæ as far as the words 'I believe in the Holy Ghost;' after which follow the anathemas referred to above. The remaining clauses of the present creed, although they seem to have been in public use earlier, were formally added in the First Council of Constantinople (381), with the exception of the clause, 'And from the Son,' which was introduced in various churches of the West in the 5th and 6th centuries; and ultimately its formal embodiment in the creed, has continued a subject of controversy with the Greeks to the present day. See GREEK CHURCH. This creed appears to have been used in the public liturgy from the latter part of the 5th century. Its position in the liturgy varies in the different rites. In the Roman liturgy it is read on all Sundays, feasts of our Lord, of the blessed Virgin Mary, apostles' days, and all the principal festivals, but not on week-days, or the minor saints' days.

Several Arian creeds, in opposition to that of Nice, were drawn up at Sirmium and elsewhere (see LIBERIUS), but none of them met with general acceptance.

**NICHE**, a recess formed in a wall to contain a statue or some ornamental figure. In classic architecture, the niches are generally square recesses with canopies formed by small pediments. In Gothic architecture, the niche is one of the most frequent and characteristic features; the doorways, buttresses, and every part of the buildings being in many instances ornamented with niches and statues in endless variety.

**NICHOLAS**, the name of five among the Roman pontiffs, of whom the following alone appear to call for separate notice.—N. I. was born of a noble Roman family, and on the death of Benedict III., in 858, N. was elected to succeed him, and was consecrated in St Peter's Church, in the presence of Ludwig II., emperor of Germany. The earliest incident of importance of his pontificate is his conflict with Photius (q. v.), who had been intruded into the see of Constantinople after the deprivation of Ignatius. N. demanded from the emperor the restoration of Ignatius, as well as the withdrawal of certain attempted invasions of the jurisdiction of the West. On the refusal of his demands, N. excommunicated Photius (see GREEK CHURCH), and that patriarch, in return, assembled a council at Constantinople, and retorting upon his rival the same sentence, alleged that with the translation of the seat of civil sovereignty from Rome to Constantinople the ecclesiastical supremacy was likewise transferred. The Emperor Michael supporting Photius in his claim, N. failed to command submission to his sentence; nor was it till the following reign, that of Basil the Macedonian, that Photius was deposed, and Ignatius restored to his see. Meanwhile, however, N. had been embroiled with the Emperor Ludwig. The pope had been appealed to by the unjustly divorced wife of Ludwig's younger brother, Lothaire, king of Lorraine, and had appointed legates to inquire into and report upon the case; and the legates having exceeded their powers by giving a sentence in favour of Lothaire, the pope declared their sentence null, and excommunicated them. Ludwig espoused their cause, and marched his troops to Rome, in order to enforce satisfaction. After some hostile demonstrations, the emperor, terrified, it is said, by his own sudden illness, and some fatalities which befell his followers, desisted from the enterprise, and withdrew his troops. Lothaire was forced to make submission; the decree of N. was enforced, and Theutberga was formally reinstated in her

position as a wife and queen. N. died in 868.—**NICHOLAS V.** was originally called Thomas Parentucelli. Born at Pisa in 1398, he was educated at Florence and Bologna, and having fixed his residence in the latter city, he was eventually named bishop of that see by the pope, Eugenius IV. During the troubled period of the Councils of Basel and Florence, and in the difficult negotiations with the German and other churches which arose therefrom, he conducted himself with such ability and prudence, that on the death of Eugenius IV. he was chosen to succeed him on March 6, 1447. At this time, the anti-pope, Felix V., still maintained himself, although supported by a very small party; but N. prevailed on him to abdicate, and thus restored the peace of the church in 1449. In the judgment of the literary world, however, the great distinction of the pontificate of N. lies in the eminent service which he rendered to that revival of letters which dates from his age. The comparative repose in which he found the world at his accession, enabled him to employ, for the discovery and collection of the scattered master-pieces of ancient learning, measures which were practically beyond the resources of his predecessors. He despatched agents to all the great centres, both of the East and of the West, to purchase or to copy every important Greek and Latin manuscript. The number collected by him was above 5000. He enlarged and improved the Roman university. He remodelled, and may almost be said to have founded, the Vatican Library. He caused translations to be made into Latin of most of the important Greek classics, sacred and profane. He invited to Rome the most eminent scholars of the world, and extended his especial patronage to those Greeks whom the troubles of their native country drove to seek a new home in the West. Alarmed by the progress of the Turkish arms in Asia, he endeavoured to arouse the Christian princes of Europe to the duty of succouring their brethren of the East; but the age of enthusiasm was past, and he was forced to look on inactively at the fall of Constantinople in 1453. This event, by forcing a large number of learned Greeks to repair to Italy and other countries of the West, contributed powerfully to that progress of learning which N. had deeply at heart; but he scarcely lived to enjoy this result, having died two years later, in 1455, at the comparatively early age of 57. He must not be confounded with an anti-pope of the same name, Peter de Corbario, who was set up, in 1328, by Ludwig of Bavaria, in antagonism to John XXII. (q. v.).

**NICHOLAS I.**, more properly **NIKOLAI PAULOVITCH**, emperor of Russia, was the third son of Paul I., and was born at St Petersburg, 7th July 1796. He was very carefully educated under the eye of his mother, a princess of Wurtemberg, and subsequently devoted his attention to military studies and political economy, without, however, giving evidence of any natural capacity for these subjects. He visited England and other European countries in 1816, and in the same year made a tour through the Russian provinces. On 13th July 1817, he married Frederika-Louisa-Charlotte-Wilhelmina, the eldest daughter of Frederic William III. of Prussia, and lived in domestic retirement till the death of Alexander I. (December 1825), when, owing to the resignation of his elder brother Constantine, he succeeded to the throne of Russia. A long-prepared military conspiracy broke out immediately after his accession, which he suppressed with great vigour and cruelty. Capital punishment, which had been abolished by the Empress Elizabeth, was revived, for the purpose of inflicting it upon the leaders of the insurrection.

# NICOBAR ISLANDS—NICOMEDEIA.

during the manufacture of *Smalt* (q. v.), by somewhat complicated chemical processes. In small quantities, it may be obtained by reducing one of its oxides by means of hydrogen at a high temperature, or by exposing the oxalate to a very high temperature in a crucible lined with charcoal.

N. forms two compounds with oxygen—viz., a protoxide,  $\text{NiO}$ , and a sesquioxide,  $\text{Ni}_2\text{O}_3$ , which is not basic, and may be passed over without further notice. The *protoxide* occurs as a greenish-gray powder, which exhibits no magnetic properties, and is insoluble in water. It is obtained by heating the carbonate or the *hydrated protoxide* in a closed crucible. The *hydrated protoxide*,  $\text{NiO} \cdot \text{HO}$ , is obtained by precipitation from a solution of one of its salts by potash. The salts of the protoxide and their solutions are of a delicate, very characteristic green colour; but in the anhydrous state most of them are yellow. The neutral salts, soluble in water, slightly redden litmus, have a sweetish astringent metallic taste, and when administered in moderate doses, excite vomiting. The most important of the salts is the sulphate ( $\text{NiO} \cdot \text{SO}_3 + 7 \text{Aq}$ ), which crystallises in beautiful green rhombic prisms. It is obtained by dissolving the metal or its oxide in dilute sulphuric acid; and is the source from which the other salts of N., the carbonate, oxalate, &c., are obtained. The principal use of N. is in the composition of various alloys, such as German Silver (q. v.).

The sulphate of N. has been prescribed successfully by Professor Simpson in cases of severe headache.

**NICOBAR ISLANDS**, a group of islands in the Indian Ocean, north-west of Sumatra, and forming, with the Andamans (q. v.), an extension of the great island chain of which Java and Sumatra are the principal links. Lat.  $6^\circ 40' - 9^\circ 20' \text{ N}$ , long.  $93^\circ - 94^\circ \text{ E}$ . They are divided by the Sombrero Channel into two groups, of which the principal members are the Great N. (area about 260 square miles), and the Little N. (area 86 square miles). Population in all, estimated at 6000, who are principally Malays. The cocoa-nut and banana grow everywhere on the shores. The soil is fertile, the mean annual temperature is  $70^\circ \text{ F}$ ., and the climate is so unhealthy, that the islands are quite unsuited for colonisation. The Danes claimed the islands in 1841, but abandoned their claim in 1848. The inhabitants are known in several instances to have seized vessels that have touched at the N. I., murdered the crews, and rifled and sunk the ships.

**NICOLAI, CHRISTOPH FRIEDR.**, a celebrated German author, bookseller, and publisher, was born 18th March 1733, at Berlin, where his father was also a bookseller. He devoted himself very earnestly to literary and philosophical studies, and early distinguished himself by his *Briefen über den jetzigen Zustand der schönen Wissenschaften* (Berl. 1756), in which he exposed the errors of both Gottsched and Bodmer, then carrying on a controversy which was agitating the literary world of Germany. He became the associate of Lessing and Moses Mendelssohn. Jointly with the latter, he edited for some time the admirable *Bibliothek der schönen Wissenschaften* (Leip. 1757—1758); and with Lessing, he gave to the world *Briefe, die neueste deutsche Literatur betreffend* (24 vols. Berl. 1759—1765). By this he was led to conceive the plan of the *Allgemeinen deutschen Bibliothek* (106 vols. 1765—1792), a periodical which he edited for many years, and which contributed much, particularly in the early period of its existence, to the progress of literature and improvement of taste in Germany, but was too frequently characterised by an undue acerbity of

tone. N.'s hostility to the new schools of literature and philosophy, which sprang up in Germany, exposed him to attacks from the pens of Herder, Goethe, Schiller, Lavater, and Fichte. His death took place 8th January 1811.

Among N.'s works may be mentioned his *Topographisch-historische Beschreibung von Berlin und Potsdam* (Berl. 1769, 3d edit. 1786); *Characteristischen Anekdoten von Friedrich II.* (Berl. 1788—1792), both of permanent value; some novels, as his *Leben und Meinungen des Magisters Sebaldus Nothanker* (4th edit. Berl. 1799); *Geschichte eines dicken Mannes*, a sharply satirical performance (2 vols. Berl. 1794); *Beschreibung einer Reise durch Deutschland und die Schweiz* (Berl. 1781; 3d edit. 12 vols. 1788—1796); an autobiography, published in the *Bildnissen jetzt Ueber Berliner Gelehrten*; and a work entitled *Ueber meine gelehrte Bildung, über meine Kenntniss der Critischen Philosophie und meine Schriften dieselbe betreffend, und über die Herren Kant, J. B. Erhard, und Fichte* (Berl. 1799).

**NICOLAS, St.**, a highly popular saint of the Roman Catholic Church, and revered with still greater devotion by the Russian Church, which regards him as a special patron, was one of the early bishops of Myra in Lycia. The precise date of his episcopate is a subject of much controversy. According to the popular account, he was a confessor of the faith in the last persecution under Maximian, and having survived until the Council of Nice, was one of the bishops who took part in that great assembly. This, however, seems highly improbable. His name does not occur among the signatures to the decrees, nor is he mentioned along with the other distinguished confessors of the faith who were present at the council, either by the historians, or what is more important, by St Athanasius. He may, with more probability, be referred to a later period; but he certainly lived prior to the reign of Justinian, in whose time several of the churches of Constantinople were dedicated to St Nicolas. Of his personal history hardly anything is certainly known, and the great popularity of the devotion to him rests mainly on the traditions, both in the West and in the East, of the many miracles wrought through his intercession. He is regarded, in Catholic countries, as the especial patron of the young, and particularly of scholars. In England, his feast was celebrated in ancient times with great solemnity in the public schools, Eton, Sarum Cathedral, and elsewhere; and a curious practice, founded upon this characteristic of St N., still subsists in some countries, especially in Germany. On the vigil of his feast, which is held on the 6th December, a person in the appearance and costume of a bishop assembles the children of a family or of a school, and distributes among them, to the good children, gilt nuts, sweetmeats, and other little presents, as the reward of good conduct; to the naughty ones, the redoubtable punishment of the 'Klaubauf.' The supposed relics of St N. were conveyed from the east to Bari, in the kingdom of Naples, towards the close of the 11th c.; and it is a curious fact that in the Russian Church the anniversary of this translation, 9th May, is still observed as a festival.

**NICOMEDEIA**, the capital of ancient Bithynia, was situated at the north-eastern angle of the Gulf of Astacus, in the Propontis, now called the Bay of Ismid, was built about 264 A. D. by Nicomedes I., who made it the capital of his kingdom, and it soon became one of the most magnificent and flourishing cities in the world, and some of the later Roman emperors, such as Diocletian and Constantine the Great, selected it for their temporary residence. It

# NIELLO-WORK—NIEPCE DE ST VICTOR.

in 1806, and during the three succeeding years shared in the vicissitudes which befell the rest of his chief, Count Hardenberg, after the disastrous battle of Jena, and the consequent fall of the Napoleonic influence on the management of the state. The opening of the university in 1810 was a new era in the life of N., in the view of promoting the interests of the nation, gave a course of lectures on Roman history, which, by making known the results of the critical theory which he had applied to the examination of obscure historical evidence, established him as one of the most original and philosophical of modern historians. His appointment, in 1812, to the post of Prussian ambassador at the court of Vienna, where he remained till 1823, gave him an opportunity of testing on the spot the accuracy of his conjectures in regard to many questions of Roman social bearing. On his return from Vienna, he took up his residence at Bonn, where, by his able lectures and expositions, he contributed materially to the development of classical philological learning. He was thus employed when the revolution of 1830 roused him from his literary pursuits. N.'s sensitive nature, weakened by physical debility, led him to take an exaggerated view of the consequences of this movement, and to anticipate a recurrence of all the misfortunes of the former French revolution, and the result was a state of mental depression, which ended in his death on January 1831. N.'s attainments embraced an extensive range than most men are capable of, for he was alike distinguished as a man of business, an able diplomatist, an scholar, and a man of original genius. He mastered twenty languages before the age of thirty, and he piled the mass of facts which his tenacious memory retained, and the intuitive sagacity that enabled him to sift true from false historic evidence, on to supply by felicitous conjecture the missing links in some imperfect chain of evidence, the extraordinary scope of his intellect, which could not be denied, however, that he is often over-credulous and unhistorical in his conjectures, and is the sort of sceptical critics, like the late Sir John Lubbock, even go so far as to regard his attempts to construct a continuous Roman history from legendary materials as we possess as, on the whole, a failure. Among the many important works which he enriched the literature of Germany, the following are some of the most notable: *Römische Geschichte* (3 Bde. Berl. 1811—1816, 1827—1842; 1833; 1853), the first two volumes have been translated by J. C. Hare, the third by Dr W. Smith; *Grundzüge für die Verfassungsgeschichte* (Berl. 1832); *Griech. Heroengeschichte* (1842), written for his son Marcus; the *historischen und philologischen Schriften* (Bonn, 1828—1843), contain his introductory lectures on Roman history, and many of the essays which appeared in the *Transactions of the Academy*. Besides these, and numerous essays on philological, historical, and archaeological questions, N. co-operated with Bekker and others as an annotator in re-editing *Scriptores Byzantini*; he also discovered hitherto unknown fragments of classical authors, as, for example, of Cicero's *Orations* and portions of Gaius, and the *Inscriptiones Nubienses* (Rome, 1821), a constant contributor to the *Rheinische Literatur für Philologie*, and other literary journals of Germany.

**NIELLO-WORK**, a method of ornamenting metal by engraving the surface, and rubbing

in a black or coloured composition, so as to fill up the incised lines, and give effect to the intaglio picture. It is by no means quite certain when this art was originated; Byzantine works of the 12th c. still exist to attest its early employment. The finest works of this kind belong to the former half of the 15th c., when remarkable excellence in drawing and grouping minute figures in these metal pictures was attained by Maso di Finiguerra, an eminent painter, and student of Ghiberti and Massaccio. In his hands it gave rise to copper-plate engraving (see **ENGRAVING**), and hence much interest attaches to the art of niello-cutting. Genuine specimens of this art are rare, some of those by Finiguerra are very beautiful and effective, the black pigment in the lines giving a pleasing effect to the surface of the metal, which is usually silver. Those of his works best known are some elaborately beautiful pattines wrought by him for the church of San Giovanni at Florence, one of which is in the Uffizia, and some are in various private collections. In the collection of Ornamental Art at South Kensington, there are no less than 17 specimens of this art.

**NIE'MEN** (called by the Germans *Memel*), a river in Prussia, rises a few miles south of the city of Minsk, flows westward to Grodno 180 miles, north and west along the frontiers of the Polish province of Augustowo, and west through East Prussia to the Kurische Haff. Entire length, 640 miles. It is navigable for large craft at Grodno, 400 miles from its mouth, and is free of ice from March to November. Between Grodno and Kovno there are 55 rapids and shallows, and pilots are therefore required for the navigation of the river. At Winge, 8 miles below Tilsit, the N. divides into two branches, of which the northern, the Russ, reaches the Kurische Haff by nine mouths; and the southern, the Gilge, by seven mouths. The delta is traversed by numerous canals. The N. is of considerable commercial importance. Large barges bring down the produce of Lithuania and of a portion of Poland to Königsberg and Memel. Corn, hemp, flax, hides, and bacon are the principal articles brought from the interior. Its principal affluent is the Vilia on the right.

**NIEPCE DE ST VICTOR**, CLAUDE-FELIX-ABEL, a French chemist and photographer, was born at Saint Cyr, near Chalon-sur-Saône, 26th July 1805. He served for some time in the army; but having made an important chemical discovery in connection with dyeing, he was permitted to exchange into the municipal guard of Paris, that he might pursue his scientific studies with more facility. This was in 1845, at which time his attention having been forcibly attracted to the important discoveries in photography which had been made by his uncle Nicéphore Niepce (see **PHOTOGRAPHY**), he resolved to devote his energies to this subject. He was led, in 1847, to the discovery of methods for obtaining images on glass, coated with albumen, starch, or gelatin, and for reproducing designs by the use of vapour of iodine. His investigations were for a time interrupted by the revolution of 1848, but he soon resumed them, directing his attention more especially to the obtaining of photographic images in colours; and before the close of 1852, he had succeeded in obtaining faithfully coloured images of flowers natural and artificial, coloured engravings, gold and silver lace, &c., upon silvered plates which had been sensitised by a chloride of copper. In obtaining these pictures, both photographic printing and the camera were employed; but to his intense disappointment, he found that

# NIERSTEIN—NIGER.

the colours soon began to fade, and after a time disappeared. This process he named 'Heliochrome.' His third and most important invention, that of the art of 'Heliography,' or the production of engraved steel-plates by photography, was first communicated to the Academy of Sciences in May 1853. He does not deserve the credit of having originated the idea; for his uncle, previous to 1839, had communicated an imperfect sketch of a similar invention to M. Arago; and Mr Talbot and others had succeeded by a similar process in obtaining images of simple objects on steel-plates; but to N. belongs the credit of having removed the almost insurmountable manipulative difficulties, and rendered the process of much more general application, thus making it practically serviceable. He afterwards employed himself in improving and perfecting his various discoveries.

In 1855, he published the various memoirs in which he had at different times communicated his three great discoveries to the Academy of Sciences, under the title of *Recherches Photographiques*, which was followed, in 1856, by *Traité Pratique de Gravure sur Acier et sur Verre*. He presented to the Academy a number of memoirs on the action of light on a variety of substances, the last being *Sur l'Action de la Lumière et de l'Electricité* (February 1860). N.'s scientific studies did not interfere with his military promotion, as he was successively appointed chef-d'escadron, and (1854) commandant of the Louvre. He died in April 1870.

**NIERSTEIN**, a market village (pop. 2600) of Hessen-Darmstadt, in the province of Rhein-Hessen, and 9 miles south-south-east of Mayence, gives name to a well-known and highly-prized variety of Rhenish wine, which is produced in the neighbourhood.

**NIEUWVELDT MOUNTAINS**, a portion of the most northerly of the three ranges of mountains in Cape Colony, which at various distances from the southern coast all run parallel to it. Of these three ranges, the most northern attains the greatest altitude, having an average height of 7000 feet. The portion known as the N. M. extend in lat. 31° 40' to 32° 30' S., and are intersected by the meridian of 22° E. long. From their southern slopes, the Gamka or Lion River draws its head waters; and from their northern, the Gariep or Orange River obtains an important tributary in the Upper Zak.

**NIEVRE**, a central department of France, occupies a portion of the watershed between the Loire and the Seine, and is bounded on the west by the rivers Allier and Loire. Area, 1,684,469 acres; pop. (1872) 339,917. Mountains occupy the eastern border, and extend in a line of heights from south-east to north-west, dividing the department into two great declivities. The soil is generally rocky and sandy, cut up by ramifications, almost always wooded, of the mountains of Morvan. There are several plateaux more or less fertile, a number of hills covered with vines, and valleys productive in pastures; but the principal wealth of the department consists in its forests and minerals. The Nièvre, whence the name of the department, is an inconsiderable affluent of the Loire from the right. The three chief rivers—the Allier, Loire, and Yonne—are navigable, and the Yonne, which belongs to the system of the Seine, is connected with the Loire by a canal leading across the watershed. Of the entire area, 792,000 acres were in 1864 in cultivable land, and more than a third of the whole surface is covered with forests, the timber from which, forming one of the principal sources of wealth, is conveyed by water in great quantities to Paris, &c.

About 6,000,000 gallons of wine are made from the mines of N. iron of good quality obtained in abundance; lead, copper, and also found; and there are coal mines, and of marble and granite. Arrondissements: Château-Chinon, Clamecy, and Cosne; Nevers.

**NIFLHEIM** (from the same roots as *Nid* cloud, and *Eng. home*), meaning the abode of the dead, was one of the nine separate abodes or realms which the old Scandinavians conceived the universe consisting in the beginning of time. It was a kingdom of cold and darkness, and is separated from Muspelsheim, the kingdom of light and fire, by a huge chasm (*Ginungagap*, yawning gap). It flows the spring *Hvergelmir*, watched by the *Nidhugger*; this spring sends out twelve rivers from the drops of which, thawed by sparks from Muspelsheim, sprang the chaotic giant *Ymir*, the cow *Audhumbla*. N. was also the abode (*q. v.*), the goddess of death, who here received the souls of those who died of sickness or old age.

**NIGELLA**, a genus of plants of the order *Ranunculaceæ*, having five coloured sepals; five or ten small two-lipped petals; a tubular claw; the carpels more or less united together, many-seeded; the leaves divided

*Nigella arvensis*:  
a, top of stem, with leaves and flowers; b, the

threadlike segments, the flowers solitary at the end of the stem or branches. They are annuals, chiefly of the countries near the Mediterranean, but some are found in the warmer temperate parts of Asia. Some of them, occasionally seen in gardens in Britain, are vulgarly known by the names *Devil-in-a-mist*, *Devil-in-a-mist*. The seeds are aromatic and somewhat peppery. Those of *N. arvensis*, a species common in cornfields in the south of Europe, are supposed to be the **BLACK CUMMIN** of the ancients, and perhaps the **CUMMIN** of the Bible. The seeds of *N.* are much used by the Arabs for flavouring curries.

**NIGER**, the great river of Western Africa, according to Dr Barth, is a contraction of one of the native names, *N-gô*, which is well as all the other names, *Dahab*, *Joliba*, *Fa*, *Kwâra* (*Quorra*), and *Bahia*, &c., simply 'the river.' The principal headwaters are on the slopes of Mount Lanna, a peak of the Fouta mountains, in a barren, desolate, and high region, in lat. 9° 25' N., long. 9° 45' W., about 1000 feet above sea level. It flows north-

## NIGHT-HAWK—NIGHT HERON.

As it bends eastward, and after flowing in that direction for about 250 miles, it curves toward the south, and proceeds in a general south-south-east direction, until arriving at the head of its delta, in about 5° 30' N., it separates into many branches, entering the Gulf of Guinea, between the Bights of Biafra and Benue. It is called the Timbri for the 10 miles of its course, after which it receives the name of the Joliba, or more correctly Dhiidlibá; after passing Timbuktu, it is known principally as the Quorra. Little is known of its course until it reaches Sego (lat. 12° 30' N.), a distance of 350 miles from its source, but from that point it has been explored throughout nearly the whole of its course.

From Sego to Timbuktu it flows through a fertile country, producing rice, maize, and vegetables, and abounding in good pasturage. In lat. 14° 10' N., the river separates into two branches; the western branch is the Joliba or Mayo, the eastern the Bara. These, as they proceed, are known as the Niger and Black Rivers respectively; and they meet after enclosing the island of Jimbilla, 220 miles in length, and from 2 to 20 miles in breadth. The river again bifurcates before arriving at Timbuktu, and after passing that town, the two branches, on one of which—the northern—Cabra, a part of Timbuktu is situated, again unite. In the district of union, in the south-west of Timbuktu, the country far and wide is intersected by numerous streams, forming a complicated network of courses. The river then flows east, sending many creeks and branches to Bamba; its banks are low and marshy, and during the rainy season are overflowed. In this region, rice, tobacco, and even barley are grown. The river passes the town of Burrum, where it curves to the south-east, and from this point—called the bend, the *Knee of Burrum*—it bears the name Kwara or Quorra until it reaches the delta. Immediately below Burrum, the N. does not have an imposing appearance. Its bed resembles a marshy valley, enclosed by ridges of rock and dunes, thickly overgrown with reeds and grass, and cut up by numberless streams and rivulets. At the ferry of Burri (lat. 15° 55' N.), the breadth of the river is from 800 to 900 yards; here the whole valley, about 10 miles broad, is fertile, carefully cultivated, and well peopled. Farther south, the towns of Garu and Sandu are passed, and here the bed is rocky and the navigation dangerous. At the town of Say, the river, after reaching a breadth of from 2500 to 3000 paces, is narrowed to a width of 1000 paces, at the rate of three miles an hour, and is bordered by rocky banks. From Say to Wara, the course of the N. remains still unknown. From Wara it flows east-south-east to Rabba; and from Rabba to its mouth, the course of the river is comparatively well known. In lat. between 8° and 10° N., it flows round the eastern shoulder of the Fouta Mountains (2000 to 3000 feet high), and here the banks of the N. are extraordinarily beautiful. At 7° 40' N., it receives the Benue from the north. The delta consists of an immense mangrove swamp, cut up into islands by the numerous branches (numbered) of the river. The principal mouths are the Bonny, Mari, and Nun.

The existence of the N. seems to have been first known in ancient times by travellers from the eastern shores of the Mediterranean, who, crossing the great desert, came upon the upper course of a river flowing toward the rising sun. This river was supposed to be a branch of the Nile.

Pliny speaks of the *Nigris* of the ancients, and thought that it flowed into the Nile. The notion that the river had

been formed until it was visited by Mungo Park in July 1796, when this traveller explored its banks for a distance of 160 miles. See PARK, Mungo. Caillié explored the river from the town of Jenne to Timbuktu; and the English expedition of 1832, under Lander and Allen, proved that the Quorra was navigable from Boussa to the sea; information, however, which was obtained at an immense cost of human life from the unhealthiness of the climate. Subsequent expeditions have ended with similar results. In 1854, Dr Barth followed the course of the river from Timbuktu to Say, and much of what is now known about the N. is due to his labours. The entire length of the river is estimated at upwards of 2500 miles.—Barth's *Travels in Central Africa*.

**NIGHT-HAWK** (*Chordeiles Virginianus*), a bird of the Goatsucker family (*Caprimulgidae*), very common in America, from the Arctic islands to the West Indies. It is a bird of passage, visiting the north in summer. It is about nine inches in length, and 23 inches in expanse of wing. The gape is destitute of bristles. The tail is slightly forked. The general colour is brown, but it is much mottled and marked with white; and there is a white mark on the throat, in shape like the letter V. The N. is seen pursuing its insect

Night-hawk (*Chordeiles Virginianus*).

prey in the air, chiefly a little before sunset, and before dawn, and attracts attention by its rapid repetition of a sharp impatient cry, which has gained for it the name *Piramidig*. It produces also in its flight a remarkable hollow booming sound, 'like blowing into the bung-hole of a barrel,' in the moments of its perpendicular descent through the air. Its movements in the air are extremely beautiful and rapid. When fat and plump, as it usually is on its southward migration, it is esteemed for the table, and great numbers are shot.

**NIGHT HERON** (*Nycticorax*), a genus of *Ardeida* (see HERON), intermediate in form between bitterns and herons, but with shorter and thicker bill than either, and legs shorter than in herons. The Common N. H. (*N. Gardeni* or *Europæus*) is found in Europe, Asia, Africa, and North America, chiefly in the warmer temperate regions. It is most abundant in America, and is partly a bird of passage. It is a very rare visitant of Britain. Its length, from the tip of the bill to the end of the short tail, is fully two feet. It weighs nearly two pounds. Its plumage is soft, the general colour ash-gray, passing into black on the neck and head, and into white on the breast and belly. The back of the head is adorned with three very long white feathers, which hang down on the neck. The nests are built in trees, and in general many together, forming a *heronry*. The N. H. feeds chiefly by twilight or at night; and is never seen standing

# NIGHTINGALE.

motionless, like herons, but walks about in search of prey, by the sides of ditches, ponds, &c.; its food consisting chiefly of fishes, frogs, and other aquatic

Night Heron (*Nyticorax Gardeni*).

animals. Its cry is very loud and hoarse.—Other species of N. H. are found in Africa and Australia.

**NIGHTINGALE, FLORENCE**, famed for her labours in reforming the sanitary condition of the British army, is the daughter of William Shore Nightingale of Embly Park, Hampshire, and Leigh Hurst, Derbyshire, and was born at Florence in 1823. Highly educated, and brilliantly accomplished, she early exhibited an intense devotion to the alleviation of suffering, which, in 1844, led her to give attention to the condition of hospitals. She visited and inspected civil and military hospitals all over Europe; studied with the Sisters of Charity in Paris the system of nursing and management carried out in the hospitals of that city; and, in 1851, went into training as a nurse in the institution of Protestant Deaconesses at Kaiserswerth, on the Rhine. On her return to England, she put into thorough working order the Sanatorium for Governesses in connection with the London institution. Ten years was the term of apprenticeship thus served in preparation for the work of her life. In the spring of 1854, war was declared with Russia, and a British army of 25,000 men sailed to the East. Alma was fought on the 20th of September, and the wounded from the battle were sent down to the hospitals prepared for their reception on the banks of the Bosphorus. These hospitals were soon crowded with sick and wounded, and their unhealthy condition became apparent in a rate of mortality to which the casualties of the fiercest battle were as nothing. In this crisis, Miss N. offered to go out and organise a nursing department at Scutari. The late Lord Herbert, then at the war-office, gladly accepted, and within a week from the date of the offer—viz., on the 21st of October—she departed with her nurses. She arrived at Constantinople on the 4th of November, the eve of Inkermann—the beginning of the terrible winter campaign—in time to receive the wounded from that second battle into wards already filled with 2300 patients. Her devotion to the sufferers can never be forgotten. She has stood twenty hours at a stretch, in order to see them provided with accommodation and all the requisites of their condition. But she saw clearly in the bad sanitary arrangements of the hospitals the causes of their frightful mortality, and her incessant labour was devoted to the removal of these causes, as well as to the mitigation of their effects. In the spring of 1855, while in the Crimea organising the nursing-departments

of the camp-hospitals, she was prostrated by fever, the result of unintermitting toil; yet she refused to leave her post, and very remained at Scutari till Turkey was evacuated by the British, July 28, 1856. She, like a soldier owes life and health, had her own health in the physical and mental she had subjected herself. It is known that her sick-room has been the most arduous and constant labour for the benefit of the health of the soldier. She furnished the 'commissioners appointed into the regulations affecting the sanitary condition of the British army' with a paper of evidence, in which she impresses, with clearness which distinguish her mission of the Crimean War, which she treated as a sanitary experiment on a colossal scale. Her experience in the Crimea, the result of the labours of the sanitary commission accumulated under her own eyes, she turned to the question of army sanitary reform, and of army hospitals. In 1858, she contributed papers to the National Association for the Promotion of Social Science, on Hospital and Arrangement, afterwards published her evidence before the commission of the National Association. The *Notes on Hospitals* are most valuable to the architect, the medical officer. In 1858, she published *Notes on Nursing*, a little volume which among the treasured text-books of medicine holds a high place. At the close of the Crimean War she subscribed for the purpose of enabling an institution for the training of nurses, of the fund amounts to £1400 per annum, though no separate institution has been opened, is spent in training a superior order of connection with St Thomas's and King's Hospitals. In the year 1863 was issued a Report of the Commission on the Sanitary Condition of the Army in India. The complete Report, which occupies two folio volumes of nearly 1000 pages. The second of these huge folios is filled with from every station in India, occupied by British and native troops. These reports were sent to Miss N., and at page 347 of the first inserted her observations upon this immense mass of evidence. In these observations, she brought together in an order, and with an force of statement, which render it one of the remarkable public papers ever penned. That is likely to inaugurate a new era in the history of India; for the views of Miss N. extend to the sanitary reform of the British army, that of the towns of India. In 1871, Miss N. published *Notes on Lying-in-Institutions*, together with a proposal for organising an Institution for Midwives and Midwifery Nurses. In the March of *Fraser's Magazine*, 1873, she published an article entitled, "A Note" of Interrogation, which attracted a good deal of attention, mainly on account of the way she handles religious beliefs and the

**NIGHTINGALE** (*Philomela*), a genus of the family *Sylviada*, approaching in character the *Merulida*, the young having their feet plumbeous mottled, as in the thrushes, and the legs longer than in the fauvettes and other *Sylviada*, which they are commonly classed. The bill is straight, slender, not quite as long as the head, wings do not much pass beyond the base of the

# NIGHT-JAR—NIGHTSHADE.

is very short, the third is the longest; slightly rounded.—The COMMON N. (*Philomela*) is well known as the finest of songsters, larger than the hedge-sparrow, with the proportionate length of wings and a rich brown colour above, the rump lish, the lower parts grayish-white. It is a native of many parts of Asia, and of the north of Africa; and is, in age, extending its summer migrations out of Europe as far north as the south of Britain it has scarcely ever been north than Yorkshire. It is plentiful in the south and east of England, but not to the western counties, and never land. It frequents thickets and hedges, and meadows near streams. The extensive gardens near London are among its haunts. It feeds very much on caterpillar larvæ. It arrives in England about

Nightingale (*Philomela lusciniæ*).

April, the males ten or fourteen days later. It is at this season, and before their place, that bird-catchers generally use nightjals for cage-birds, as they then are reconciled to confinement, whilst, if during, they fret and pine till they die. Its nest generally on the ground, but at a low fork of a bush. The nest is constructed of dead leaves, rushes, and moss, with a lining of fibrous roots. The eggs are five in number, of a uniform olive-green. The song of the male ceases to be heard as the season is over. In captivity, however, continued through a more considerable time, usually begins its song in the evening with brief intervals throughout the night, variety, loudness, and richness of its song is extraordinary; and its long quivering full of plaintiveness as well as of ecstasy. The N. has been a favourite bird of ancient times; and is often mentioned in the legends of India and Persia, as well as of Greece. The loves of the N. and the rose are a theme in which eastern poets delight. The Nightjar resembles the redbreast in manners, and is very cautious. It has been known to breed in captivity.—There is another species of N. in the east of Europe, called the Nightjar.

AR. See GOATSUCKER.

ARE (*Incubus*, *Ephialtes*) consists in a dream, the terror being inspired by a light or oppression referred to the preternatural, giants, hags, serpents, upon the

breast. It is attributed to acceleration or irregularity of the circulation in the chest or in the brain. It has been traced backwards to plethora, posture, heavy suppers; and forwards as a prognostic of heart disease or hydrothorax. It differs from ordinary dreams in possessing always the same characteristic of fear of some object in contact with the body, in a recognised inability to move or speak while there is a strong desire to do both, and in the presence of a semi-consciousness of the real source of the apprehension. The affection is recorded to have been epidemic; and modern instances have occurred where large communities have been agitated by night panics. A regiment of French soldiers, quartered in a ruined monastery, were awakened, at the same hour in two successive nights, by a black dog leaping on the breast of each. These veteran warriors, injured to danger, inaccessible to superstition, could not be prevailed upon to make a third trial. Such frightful impressions occur during the day, and during mere somnolency or drowsiness, but more generally at the moment of awakening during the night. The time, the distinct recollection retained of the circumstance, and the bodily perturbation which remained when consciousness was re-established, all conspired to convert these visions into the objective hobgoblins, the omens and supernatural revelations of past ages; and which still linger as matter of belief where the temperament or situation of the individual resemble those of our ancestors. In a very large number of instances such dreams represent, or are continuations of, the previous waking thoughts and emotions. They are so far voluntary that indigestible food or excess may induce them. Fuseli, for artistic purposes, created 'chimeras dire' in sleep by supping on pork chops.

NIGHTSHADE, the English name of certain plants of the natural order *Solanaceæ* (q. v.), possessing the narcotic properties frequently developed in that order. Among them are some species of *Solanum* (q. v.), particularly the COMMON N., or BLACK N. (*S. nigrum*), an annual or biennial, with

Common or Black Nightshade (*Solanum nigrum*).

erect angular stem, ovate, sinuate-dentate leaves, drooping lateral umbels of white flowers, and globose black berries; a frequent weed in waste places in England and in most parts of the world. Few

Caucasian and Armenian, 4,199,200 roubles: total, 14,754,200 roubles. Grand total, 100,492,900 roubles.

N., an ancient town, was founded in 1221 by Prince Yuri Vsevolodovich as a stronghold against the invasions of the Bulgarians and the Mordva. It was devastated on several occasions by the Tartars; and in 1612, during the civil dissensions in Russia, when it was on the point of falling a prey to Poland, Minin, the famous butcher of N., collected an armed force here, which, under Prince Pojarsky, drove the invaders from the capital. See Moscow. The prosperity of this town dates from the year 1817, when the great fair was removed to N. from Makarief, on account of the destructive fire which broke out in the latter place, and destroyed the greater portion of the stores and magazines. The normal population of the town is (1867) 42,742; but it is increased to upwards of 200,000 during the fair. N., so favourably situated for purposes of commerce, carries on a brisk trade during the whole season of navigation, and especially in spring during full water.

NIJNI-TAGILSK, a town of Russia, in the government of Perm, situated on the river Tagil, amid the Ural Mountains, 150 miles east of the city of Perm. It is one of the most important mining towns in Russia, or in the world. The soil in the immediate vicinity is everywhere rich in iron, copper, gold, and platinum; not far off is the famous magnetic mountain Blagodat, 1422 feet high. Akimfi Demidoff (q. v.) established the first foundry here in 1725. The yield both of iron and copper is immensely large. Pop. 27,000.

NIKOLAEV, a town of South Russia, in the government of Kherson, and 40 miles north-west of the town of that name, stands 25 miles above the mouth of the Bug, and at the confluence of that river with the Ingul. It was founded in 1790, and its situation was found so convenient for ship-building purposes, that it soon became the centre of the naval administration of the Black Sea. It has broad straight streets, contains several barracks, a cathedral, schools for pilots, hospitals, an observatory, and an arsenal. During the period of its greatest prosperity (from the beginning to the middle of the present c.), 10,000 men were employed at N. in ship-building and other naval operations. Since the treaty of Paris in 1856, N. has lost much of its former importance. Pop. (1867) 67,972.

NIKOLAEVSK, chief town of the Amur territory, in Eastern Siberia, situated on a well-wooded plateau on the left bank of the Amur, and 22 miles from its mouth, in lat. 53° 15' N., long. 149° 35' E., 6750 miles east from St Petersburg. It contains a wooden church with one large and five smaller steeples, the town residence of the governor, and the storehouse of the Amur Company. The approaches to the town are defended by four batteries, which command the upper as well as the lower part of the river. The Amur is here a mile and a quarter broad, but the landing-place is available only for small craft, all large vessels being compelled to lie in mid-stream. It was founded in 1851; in 1855, it consisted of 159 houses, and in 1858, of 249 houses. It is the seat of naval and civil administration, and the centre of the commercial activity of the district. Goods from the interior of Siberia and China are brought hither and shipped in foreign (chiefly American) vessels; and Siberian traders now receive and despatch their goods by sea, as the land route formerly pursued was both tedious and expensive. Rich and extensive forests clothe the banks of the river, and the abundant pastures offer facilities for cattle-breeding. The chief hindrance to the rapid improvement of the

settlement is a want of hands and capital. A line of telegraph already extends from St Petersburg to beyond Irkutsk, and is in process of extension to Nikolaevsk. Mean temperature throughout the year, 39° 42'. Pop. 2552.

NIKOLSBURG, or MIKULOV, a town of Austria, in the south of Moravia, 27 miles south of Brunn, lies at the foot of the Pollaver Hills, famous for their rich red wines. The town belongs to the princely family of Dietrichstein. It has several steam-mills, and cotton and silk factories. In the middle of the town, upon a rock, stands the Castle of the Dietrichsteins, with a library of 20,000 volumes, and a vat in the cellars capable of containing 2000 eimers. Pop. 7173, of whom more than a half are Jews.

NIKOPOL, a thriving town of Southern Russia, in the government of Ekaterinoslav, on the right bank of the Dnieper, about 200 miles from its mouth, in lat. 47° 33' N. N. is the centre of an extensive agricultural district, the produce of which is here shipped to Odessa. Between N. and the port of Odessa, there is regular communication by steam-boat. The natural advantages of N. promise to make it one of the principal commercial centres on the Dnieper. Pop. 8758.

NILE (*Nilus*), called by the Egyptians, *Hapi Mu* (the genius of the waters), and by the Hebrews *Sihor* (the black), the river of North-eastern Africa formed by the union of the Bahr-el-Abiad (the White or True Nile) and the Bahr-el-Azrek (Blue Nile). The source of the first of these, the True Nile, or at least its great feeder, has at last been discovered by Captains Speke and Grant in the Victoria Nyanza Lake, which extends from about lat. 0° 20' N. to 2° 50' S., and from long. 31° 40' to 35° E., and is 3740 feet above the sea. The second has its source in Abyssinia, in lat. 10° 50' N., and long. 36° 55' E. From its outfall from Lake Victoria Nyanza at the 'Ripon Falls,' lat. 0° 20' N., long. 33° 30' E., the White Nile flows in a north-north-westerly direction as far as Gondokoro, which is in lat. 4° 55' N. and long. 31° 50' E., and 1900 feet above the sea. Several moderately-sized streams are supposed to flow out of the lake on each side of the main source. These are the Kafu and the Luajerré on the west, and the Asua on the east, the former joining the main stream in the Unyero, the latter in the Madi country. After issuing from the lake, the Nile passes a range of sandstone hills, then rushes down due north with the beauty of a mountain torrent, running off at last into long flats, more like a lake than a river. In the Kibi country it is navigable as far as the Karuma Falls, where it rushes on with boisterous freedom. In the Madi country the Nile has its well-known character of long flats and long rapids.

At the junction of the Asua River, in the Madi territory, lat. 4° 40' N., Captain Speke's discoveries terminated, for to this point the ivory-traders had ascended the Nile from Gondokoro. For about 500 miles after this, the river flows very tortuously, first in a north-westerly and then in a north-easterly direction, and is joined in about lat. 9° 15' N., long. 30° E., by its first great affluent, the Bahr-el-Ghazal, which joins the Nile from the west with hardly any perceptible current. The second tributary is the Sobat River, about one-third the volume of the Nile at its point of junction, long. 31° E. Its source is not known, but its character suggests the possibility of its coming from Lake Nyanza. From the Bahr-el-Ghazal the Nile flows in a due easterly direction for about 60 miles, then south for 30 miles, when it is joined by its third tributary, the Sobat River, from the east.

1000

# NILE—NILOMETER.

the shores of Lake Tanganyika, Burton was laid up by illness, and his companion, after surveying the northern portion of the lake, left him there to recruit his health, while he (Speke) proceeded northwards to discover another huge 'nyanza' or lake, of the existence of which he was informed by the natives. This he accomplished on the 3d of August 1858, when he discovered the southern end

flowing over rocks of an igneous character, and forming falls 12 feet high, which Captain Speke christened the 'Ripon Falls,' in honour of the president of the Royal Geographical Society at the time of his starting on the expedition.

In the kingdom of Karagwé, Captain Speke found a very superior negro race, much better disposed to strangers than any of the tribes he had formerly passed through. The country occupied by this race, and that of Uganda, stretches along the Nyanza, and covers half of its western and northern shores, the Uganda being bounded on the east by the main stream of the Nile. North of it lies the kingdom of Unyoro, where the dialects belonging to the language of South Africa, and which up to this point are used by the various tribes, suddenly cease, and give place to those of the language of North Africa.

At Gondokoro, Speke and Grant were met by Mr (now Sir Samuel) Baker, who had come from Cairo to their relief. Baker, accompanied by his heroic wife, pushed still farther south, and had the happiness of discovering, in 1864, another great lake, which he called the Albert Nyanza. In 1869, he undertook a second great expedition, of a military character, at the expense of the Pasha of Egypt, to suppress slavery in the upper regions of the Nile; and has reduced under the sway of that ruler the whole valley of the river as far as the Victoria Nyanza. Sir Samuel returned in September 1873.

Meanwhile, Dr Livingstone had been working for many years, from another quarter, at the solution of the great African problem—the true source of the Nile. In 1866, he began the great journey from which he was destined never to return. Starting from the Rovuma River, in the far south, he passed round the south end of Lake Nyassa, proceeded northward, exploring the lakes Bangweolo and Moero; and in 1869 reached Lake Tanganyika, a vast sheet of water south of the Albert Nyanza, but did not succeed in determining its connection with this lake. In 1871, he was found by Mr Stanley of the *New York Herald* at Ujiji, on Lake Tanganyika, and it was then his opinion that neither Tanganyika, nor the Albert Nyanza, nor the Victoria Nyanza was the true source of the Nile, nor any of the feeders of these lakes; but that it was to be sought in a basin lying westward of them, through which flow three large rivers, all called Lualaba, and which unite to form another great lake, which he called Lincoln, in honour of the president of the United States. Out of this a river runs northward, which he conceived to be the main branch of the Nile. Geographers at home generally believe that Livingstone was mistaken, and had struck instead upon the source of the Congo; but the death of the great traveller before the completion of his explorations leaves the problem still unsolved, though the final discovery cannot be far off.

**NILOMETER** (the measurer of the Nile), the name of two buildings existing in Egypt, one in the island of Rhoda, opposite to Cairo, the other at Elephantine, close to Assouan, in 24° 5' 23' N. lat. The first consists of a square well, in which is placed a graduated pillar of marble, and is called a *mekkas* or measure; the pillar contains 24 *deakhs* or cubits, each of which measure 21.386 inches, or according to Greaves, 1.824 feet, and contains 24 digits; but in its present state, it does not appear to have been intended to mark a rise of more than 16 cubits. This pillar is exceedingly slender. The building formerly had a dome, bearing a Cufic inscription, dated 847 A.D., and is said to have been erected by the Calif Mamun, or his successor Wathek Billáh. The first-mentioned monarch is said to have erected another nilometer at the village

The Upper Course of the Nile.

of the Victoria Nyanza (q. v.). In his journal he says of this immense sheet of water: 'I no longer felt any doubt that the lake at my feet gave birth to that interesting river, the source of which has been the subject of so much speculation, and the object of so many explorers.' The preceding chart represents the state of knowledge regarding the sources of the Nile at this date, but the attention of the reader is requested to the subsequent discoveries of Baker and Livingstone noticed at the close of the article.

In 1861, Captain Speke, taking with him Captain Grant, returned to the lake region. The expedition approached the Victoria Nyanza again from the coast of Zanzibar; and the first place from which they obtained a view of it, during the second expedition, was the town of Mashonde on its western side. Thence they pursued their way along the shore northwards. Crossing the equator, they reached streams which are said to flow out of the lake, and further on, in the centre of its northern coast, what they considered to be the parent stream of the Nile, 150 yards in breadth,

of Banbenouda, in the Saeed, and to have repaired an old one at Ekhnin. The Calif El Motawukkel built the present one. The mode of calculating the increase at the nilometer is rather complex, and to a certain extent arbitrary, political and financial reasons rendering the process a mystery even to the natives. At the present day the Nile is supposed to have risen to 18 cubits when the canals are cut; this is the height of the lowest inundation; 19 cubits are considered tolerable, 20 excellent, 21 adequate, and 22 complete, 24 are ruinous. In the time of Edrisi, however, 16 cubits were considered sufficient. The object of these nilometers was to measure the amount of taxation to be imposed on the country. The nilometer at Cairo is, however, much more recent than that existing at Elephantine, which consists of a staircase between two walls descending to the Nile. One of these walls has engraved on it a series of lines at proper intervals marking the different elevations to which the river rose under the Caesars. The cubits here are divided into 14ths or double digits, and measure 1 foot 8.625 inches. This nilometer is described by Strabo. The probability is, that many nilometers existed in the days of the Pharaohs, probably one in each city. In the days of Moeris, 8 cubits were sufficient, but 15 or 16 were required in the time of Herodotus, 456 B.C., and this was the mean under the Romans. According to Pliny, if the inundation did not exceed 12 cubits it produced a famine, 13 starved the country, 14 rejoiced it, 15 was safety, and 16 delight, and this number is symbolically represented by the number of children playing round the river god on statues of the Roman period. The oldest nilometer appears to have been erected at Memphis, and it was transferred by Constantine to a church in the vicinity of the Serapeum; but Julian sent it back to this temple, where it remained till its destruction by Theodosius. At the present day, the rise is watched for with anxiety, and proclaimed by four criers.—Herodotus, ii. 13; Strabo, lib. xvii.; Wilkinson, *Topogr. of Thebes*, pp. 311–317. Hekekyan Bey, *Siriadic Monuments* (Lon. 1863), p. 145.

**NIMBUS**, in Art, especially in Sacred Art, is the name given to the disc or halo which encircles the head of the sacred personage who is represented. Its use is almost universal in those religions of which we possess any artistic remains—the Indian, the Egyptian, the Etruscan, the Greek, and the Roman. In the Hebrew scriptures, we trace, in the absence of representations, the same symbolised idea in the light which shone upon the face of Moses at his return from Sinai (Exod. xxxiv. 29–35), and in the light with which the Lord is clothed as with a garment, Ps. ciii. 1, Vulg. (civ. 1, auth. vers.); and in the New Testament in the transfiguration of our Lord (Luke ix. 31), and in the 'crowns' of the just, to which allusion is so often made (2 Tim. iv. 8; 1 Peter v. 4; Apoc. iv. 4). Nevertheless, the nimbus, strictly so called, is comparatively recent in Christian art, appearing first towards the end of the 5th century. Later in Christian art, it became almost a necessary appendage of all representations of God or of the saints. Its ordinary form is the circular or semi-circular; a form, indeed, in which later symbolists discover an emblem of perfection, and of eternity; but the nimbus of the Eternal Father is often in the form of a triangle, and that of the Trinity an emanation of light, the rays of which form the three arms of a cross. The nimbus of the Virgin is sometimes a simple ring, and sometimes a crown or diadem; occasionally it is encircled by an ornamental border, on which twelve stars are sometimes represented. Her nimbus, as well as that of

the Divine Persons, is commonly of gold; of the Virgin Mary is occasionally in blue, red, purple, or white. The nimbus of saints is ordinarily the semicircle or lunula, mentions the curious instance of a picture of the traitor Judas with a black nimbus! In the Middle Ages the nimbus became lighter and more aerial, as it were, into the picture; and in Raphael it occasionally fades into the very faint suggestion of a golden tinge around the head. In connection with the nimbus may also be mentioned two analogous forms—the *Aureole* and the *Glory*. The former is an illumination surrounding the head only, but the entire figure. If the figure be upright, the aureole is commonly oval; if it is called the *vesica piscis*, and is supposed to contain an allusion to the *ichthys*. With the figure it becomes circular, and is occasionally divided by radiating bands, in the form of a wheel; sometimes it takes a quatrefoil form, commonly of gold, but occasionally also of other colours. The *Glory* is a combination of the aureole and the nimbus, and is chiefly seen in the pictures, and those of the early South German school.

#### NIMEGUEN. See NIJMEGEN.

**NÎMES** (anc. *Nemausus*), a town of France, capital of the department of Gard, situated on a fertile plain surrounded by vine-clad hills, 15 miles north-east of Montpellier, with which it is connected by railway. It consists of the town proper (ill built and dirty), and of three suburbs. In the vicinity are the beautiful ruins of the Roman aqueduct called the *Pont du Gard*. The chief of the modern edifices are the *Palace of Justice*, the theatre, and the hospitals. The *Place* is embellished with one of the most beautiful fountains in France. N. contains a museum and variously-constituted educational institutions, an important public library, Maria Theresa's (in the *Maison Carrée*), a museum of natural history, &c. It is the general entrepôt for the silks produced in the south of France, and its manufactures are principally silk and cotton fabrics. More than 10,000 looms are constantly in operation in the town, and about 6000 in the immediate vicinity. 500 handkerchiefs, lace, brandy, wines, &c., are produced. Within the town are numerous and beautiful remains, the chief of which are the amphitheatre, the *Maison Carrée* (Square House), a fine temple of Corinthian architecture; a temple of Diana consecrated to Diana; *La Tour* (Great Tower); the baths, and two Roman temples. See Menard's *Histoire des Antiquités de la France*, N. et de ses Environs (1838). Pop. (1872) 55,000.

Previously to the Roman invasion, N. was supposed to have been founded by a colony of the Massilia (Marseille)—was the chief city of the *Arecomici*. It flourished under the Romans, and was one of the great cities of Gaul. It passed to the rule of the Visigoths between 463 and 479, and afterwards to that of the Franks. Subsequently, it became a possession of Aragon, and was finally restored to France in 1259 by the king of Corbeil. The inhabitants adopted Calvinism in the 16th c., and on many occasions suffered for their religious principles. In 1791 and 1792 bloody religious and political reactions took place here.

#### NÎMROD. See BABYLON.

**NINEVEH**, or **NINUS**, a very ancient famous city, the capital of the great Assyrian empire, said in Scripture (Gen. x. 11) to have been founded by Ninus or Nimrod. It was situated on the east bank of the Tigris, opposite to the present

ousul. According to the accounts of the classic writers, the city was of vast extent, 480 stadia, or more than 60 miles in circumference. Its walls are 100 feet high, broad enough for three chariots, and furnished with 1500 towers, each 200 feet in height. In the *Book of Jonah* it is described as an exceeding great city of three days' journey, and as 'wherein are more than sixscore thousand persons that cannot discern between their right hand and their left hand' (children or infants are probably meant). After having been for many centuries the seat of empire, it was taken after a siege of several years and destroyed by the united armies of the Medes under Cyaxares, and the Babylonians under Nabopolassar, about 625 B.C. When Herodotus, not quite 200 years afterwards, and Ptolemy visited the spot, there remained only ruins. Tradition continued to point pretty accurately to the site of N.; but it is only of late years that actual explorations have been made. For account of these, see ASSYRIA.

NINGPO, a department in the province of Chekiang, China, comprising the city of that name, the Chusan group of islands, and the cities of Tsike, Ninghwa, Chinhai, and Tsangshan. The port of Ningpo is situated at the confluence of two small streams, in lat. 29° 55' N., long. 121° 22' E., 12 miles from the sea, on an alluvial flat of extreme fertility, intersected by a net-work of rivulets and canals. Its walls are five miles in circumference, but 25 feet high, 22 feet wide at the base, and 15 feet at the top, with six double gates. As is the case with the cities in this part of China, N. is permeated by canals communicating with a moat nearly surrounding the walls, and with the adjacent country. In the part of the city they expand into basins, and give the name of lakes—the Sun Lake and Moon Lake. In the former, is an island devoted to apples, and accessible by bridges. These bridges—specimens of those aerial stone edifices which adorn this part of China—are required to sustain the more than their own weight, as the roads here are all mere footpaths, and no wheeled vehicles are found. One of the rivers is crossed by a bridge of boats, 200 yards long. The entire city is well walled; the streets are wider than those of most Chinese cities, and the display of shops is indicative of wealth and luxury. Nowhere, save at Hanchuan, are there such extensive and beautiful temples to be met. The most elegant and costly of these is dedicated to the Queen of Heaven; the goddess being the daughter of a Fuhkien fisherman, the people of that maritime province are her more special worshippers. Elaborate stone sculpture, exquisitely finished carving, and a profusion of gilt and tinsel, so that no expense has been spared to honour the popular goddess.

The centre of the city is ornamented with an ancient seven-storied hexagonal tower—the heaven-towered pagoda, 160 feet in height. A spiral flight of steps within the walls of the tower lead to the summit, from which the gazer beholds a splendid scene; innumerable villages dot the plain, which is reticulated by silvery water-courses, replete with evidence of successful commerce and agriculture. The population of the city is about 300,000; that of the plain, about 2,000,000. On many of the hills which environ these cities, green tea is successfully cultivated; while the mulberry, the tallow-tree, and numerous other stimulants of industry abound. The crops of rice are procured annually from the fields; while the fisheries of the rivers and adjacent seas give employment to a numerous class of the population. Ice-houses close to the river give the city a picturesque appearance; the ice is used for cooling fish. N. has an extensive coasting trade;

but no considerable foreign trade has been developed, owing mainly to portages on the inland water-communications, and to the proximity of Shanghai, where no such obstructions exist. The district city of Chinhai, at the mouth of the Ningpo River, is also a port. A walled town, containing about 30,000 inhabitants, 10 miles to the east of Chinhai, is Kingtang, the nearest of the Chusan archipelago. Tanghai is the district city of the island of Chusan, which is 20 miles long, from 6 to 10 wide, and 51 in circumference. It is mountainous, with fertile valleys in a high state of cultivation. It has an excellent harbour. Tanghai was garrisoned several years by Her Majesty's forces from 1841, and was again temporarily occupied by the allied forces in 1860.—Dr Macgowan's *Lectures*.

NINIAN, Sr, the apostle of the Picts, lived in the latter half of the 4th and the beginning of the 5th century. Whether Christianity had been introduced among the Picts before the time of N. has been a subject of controversy; but although the details of the legendary account are uncertain, it seems, beyond all question, that some Christians were to be found, at least among the Southern Picts, in what is now known as the Lowlands of Scotland, from the end of the 2d century. Nevertheless, either their number was originally very small, or the rising church had fallen away under adverse circumstances; and it is certain that when N. appeared among them, the Picts were in the main a pagan people. He was a Briton, and of noble birth; but had been educated at Rome, and there ordained a bishop. The exact time of his preaching in Scotland is unknown. His labours appear to have commenced in Cumbria, and to have extended over the greater part of the district as far north as the Grampian Hills, his see being fixed at Candida Casa, or Whithorn in the modern Wigtonshire. His death is placed by the Bollandists in 432; his festival is the 16th September.

NINON DE LENCLOS, a celebrated French woman, one of those characters that could have appeared only in the French Society of the 17th c., was born of good family at Paris in 1615. Her mother tried to imbue her mind with a love of the principles of religion and morality, but her father, more successfully, with a taste for pleasure. Even as a child she was remarkable for her beauty and the exquisite grace of her person. She was carefully educated, spoke several foreign languages, excelled in music and dancing, and had a great fund of sharp and lively wit. At the age of ten she read Montaigne's *Essays*. Six years later, she commenced her long career of licentious gallantry by an amour with Gaspard de Coligny, then Comte de Chatillon. To Coligny succeeded innumerable favourites, but never more than one at a time. Among N.'s lovers we may mention the Marquis de Villarceaux, the Marquis de Sevigné, the Marquis de Gersay, the great Condé, the Duc de la Rochefoucauld, Marshal d'Albret, Marshal d'Estrées, the Abbé d'Effiat, Gourville, and La Châtre. She had two sons, but never shewed in regard to them the slightest instinct of maternity. The fate of one was horrible. Brought up in ignorance of his mother, he followed the rest of the world, and conceived a passion for her. When she informed him of the relation that subsisted between them, the unhappy youth was seized with horror, and blew out his brains in a frenzy of remorse. Even this calamity did not seriously affect N.; she was too well-bred to allow it to do that. N. was nearly as celebrated for her manners as for her beauty. The most respectable and virtuous women sent their

words that usually occur in the Vedas only; and the *Dairata*, which contains words chiefly relating to deities and sacrificial acts. A Commentary on this work has been composed by the same Yāska, and it likewise bears the name of Nirukta. In the latter, Vedic passages are quoted in illustration of the words to be explained, and the comment given by Yāska on these passages is the oldest instance, known at present to Sanskrit philology, of a Vedic gloss. Besides the great importance which Yāska's *Nirukta* thus possesses for a proper understanding of the Vedic texts, it is valuable also on account of several discussions which it raises on grammatical and other questions, and on account of the insight it affords us into the scientific and religious condition of its time.—Text and Commentary of *Yāska's Nirukta* have been edited by Professor R. Roth (Göttingen, 1852).

**NIRVĀNA** (from the Sanskrit *nir*, out, and *vāna*, blown; hence, literally, that which is blown out or extinguished) is, in Buddhistic doctrine, the term denoting the final deliverance of the soul from transmigration. It implies, consequently, the last aim of Buddhistic existence, since transmigration is tantamount to a relapse into the evils or miseries of *Samsāra*, or the world. But as Hinduism, or the Brahmanical doctrine, professes to lead to the same end, the difference between *Nirvāna* and *Moksha*, *Apavarga*, or the other terms of Brahmanism designating eternal bliss, and consequent liberation from metempsychosis, rests on the difference of the ideas which both doctrines connect with the condition of the soul after that liberation. *Brahman*, according to the Brahmanical doctrine, being the existing and everlasting cause of the universe, eternal happiness is, to the Brahmanical Hindu, the absorption of the human soul into that cause whence it emanated, never to depart from it again. According to this doctrine, therefore, the liberation of the human soul from transmigration is equivalent to that state of felicity which religion and philosophy attribute to that Entity (see *INDIA—Religion*). As, however, the ultimate cause of the universe, according to Buddhism, is the Void or Non-entity, the deliverance from transmigration is, to the Buddhists, the return to non-entity, or the absolute extinction of the soul. However much, then, the pious phraseology of their oldest works may embellish the state of *Nirvāna*, and apparently deceive the believer on its real character, it cannot alter this fundamental idea inherent in it. We are told, for instance, that *Nirvāna* is quietude and identity, whereas *Samsāra* is turmoil and variety; that *Nirvāna* is freedom from all conditions of existence, whereas *Samsāra* is birth, disease, decrepitude and death, sin and pain, merit and demerit, virtue and vice; that *Nirvāna* is the shore of salvation for those who are in danger of being drowned in the sea of *Samsāra*; that it is the free port ready to receive those who have escaped the dungeon of existence, the medicine which cures all diseases, the water which quenches the thirst of all desires, &c.; but to the mind of the orthodox Buddhist, all these definitions convey but the one idea, that the blessings promised in the condition of *Nirvāna* are tantamount to the absolute 'extinction of the human soul,' after it has obeyed, in this life, all the injunctions of Buddhism, and become convinced of all its tenets on the nature of the world and the final destination of the soul.

Although this is the orthodox view of *Nirvāna*, according to the oldest Buddhistic doctrine, it is necessary to point out two categories of different views which have obscured the original idea of *Nirvāna*, and even induced some modern writers to believe that the final beatitude of the oldest

Buddhistic doctrine is not equivalent to the absolute annihilation of the soul.

The first category of these latter, or, as we may call them, heterodox views, is that which confounds with *Nirvāna* the preparatory labour of the mind to arrive at that end, and therefore assumes that *Nirvāna* is the extinction of thought, or the cessation, to thought, of all difference between subject and object, virtue and vice, &c., or certain speculations on a creative cause, the conditions of the universe, and so on. All these views the Buddha himself rejects, as appears from the work *Lankāvatāra* (q. v.), where relating his discourse on the real meaning of *Nirvāna*, before the Bodhisattva Mahāmāti. The erroneousness of those views is obviously based on the fact, that the mind, even though in a state of unconsciousness, as when ceasing to think, or when speculating, is still within the pale of existence. Thus, to obviate the mistaken notion that such a state is the real *Nirvāna*, Buddhistic works sometimes use the term *Nirupadhiśesha Nirvāna*, or 'the *Nirvāna* without a remainder of substratum' (i. e., without a rest of existence), in contradistinction to the '*Nirvāna* with a remainder;' meaning by the latter expression that condition of a saint which, in consequence of his bodily and mental austerities, immediately precedes his real *Nirvāna*, but in which, nevertheless, he is still an occupant of the material world.

The second category of heterodox views on the *Nirvāna* is that which, though acknowledging in principle the original notion of Buddhistic salvation, represents, as it were, a compromise with the popular mind. It belongs to a later period of Buddhism, when this religion, in extending its conquests over Asia, had to encounter creeds which abhorred the idea of an absolute nihilism. This compromise coincides with the creation of a Buddhistic pantheon, and with the classification of Buddhist saints into three classes, each of which has its own *Nirvāna*; that of the two lower degrees consisting of a vast number of years, at the end of which, however, these saints are born again; while the absolute *Nirvāna* is reserved for the highest class of saints. Hence Buddhistic salvation is then spoken of, either simply as *Nirvāna*, or the lowest, or as *Parinirvāna*, the middle, or as *Mahāparinirvāna*, or the highest extinction of the soul; and as those who have not yet attained to the highest *Nirvāna* must live in the heavens of the two inferior classes of saints until they reappear in this world, their condition of *Nirvāna* is assimilated to that state of more or less material happiness which is also held out to the Brahmanical Hindu before he is completely absorbed into Brahman.

When, in its last stage, Buddhism is driven to the assumption of an *Adi*, or primitive, Buddha, as the creator of the universe, *Nirvāna*, then meaning the absorption into him, ceases to have any real affinity with the original Buddhistic term. See **BUDDHISM** and **LAMAISM**.

**NISHAPUR**, or **NÜSHAPUR**, a town of Persia, province of Khorassan, 53 miles west-south-west of Meshid, is situated in a most beautiful and fertile valley. Pop. about 8000. It is surrounded by a rampart and trench, and has a considerable trade in *turquoises*, which are obtained from mines in its vicinity.

**NISI PRIUS** is the name (borrowed from the first two words of the old writ which summoned juries) usually given in England to the sittings of juries in civil cases. Thus a judge sitting at *nisi prius*, means a judge presiding at a jury trial in a civil cause, and the *nisi prius* sittings are the jury sittings.

NITRATE OF POTASH. See NITRE.

NITRATE OF SODA. See NITRE.

NITRE, or SALTPETRE, as it is frequently called, is the nitrate of potash ( $\text{KO}, \text{NO}_3$ ). It usually occurs in long, colourless, striated, six-sided prisms; its taste is cooling, and very saline; it is soluble in seven times its weight of water at  $60^\circ$ , and in less than one-third of its weight of boiling water, but is insoluble in alcohol. When heated to about  $660^\circ$ , it fuses without decomposition into a thin liquid, which, when cast in moulds, solidifies into a white, fibrous, translucent mass, known as *sal prunelle*. At a higher temperature, part of the oxygen is evolved, and nitrate of potash is formed. Owing to the facility with which nitre parts with its oxygen, it is much employed as an oxidising agent. Mixtures of nitre and carbon, or of nitre and sulphur, or of nitre, carbon, and sulphur, deflagrate on the application of heat with great energy; and if nitre be thrown on glowing coals, it produces a brisk scintillation. *Touch-paper* is formed by dipping paper in a solution of nitre, and drying it.

Nitre occurs as a natural product in the East Indies, Egypt, Persia, where it is found sometimes as an efflorescence upon the soil, and sometimes disseminated through its upper stratum. The crude salt is obtained by lixiviating the soil, and allowing the solution to crystallise. A large quantity of nitre is artificially formed in many countries of Europe, by imitating the conditions under which it is naturally produced. The most essential of these conditions seem to be the presence of decaying organic matter whose nitrogen is oxidised by the action of the atmosphere into nitric acid, which combines with the bases (potash and lime) contained in the soil. 'The method employed in the artificial production of nitre consists in placing animal matters, mingled with ashes and lime rubbish, in loosely aggregated heaps, exposed to the air, but sheltered from rain. The heaps are watered from time to time with urine or stable runnings; at suitable intervals, the earth is lixiviated, and the salt crystallised. Three years usually elapse before the nitre bed is washed; after this interval, a cubic foot of the debris should yield between four and five ounces of nitre. As there is always a considerable quantity of the nitrates of lime and magnesia present, which will

not, and setting it aside to crystallise, common impurities are sulphate of potash, of sodium and potassium, and chloride of barium will detect the impurities, nitrate of silver the second, and ammonia the third.

Nitre is employed in the manufacture of sulphuric acid, in the preparation of gunpowder, as an oxidising agent in numerous chemical processes, and as an ingredient of fireworks, and in the manufacture of gunpowder. It is used in medicine. In moderate doses (ten grains to a scruple) it acts as a diuretic, and diaphoretic, and is indicated when we wish to diminish the action of the pulse, and to reduce the action of the pulmonary disorders and hemorrhages. In acute cases it is given in large doses with great effect. Physicians prescribe as much as one ounce, largely diluted with water, to be taken in the course of twenty hours; but as a single ounce has proved fatal in some cases, the effects of such large doses should be watched. It is a popular remedy in the form of nitre balls, or mixed with white sugar. In cases of spasmodic asthma, the remedy should be retained in the mouth, and the saliva impregnated with it. The inhalation of the fumes of nitre is also recommended by the ignition of *touch-paper* often affords relief in cases of spasmodic asthma.

Nitrate of potash is sometimes called *Nitre* or *Potash Saltpetre*, to distinguish it from nitrate of soda, which is known as *Soda Saltpetre*.

*Cubic Nitre*, or *Nitrate of Soda* ( $\text{NaO}, \text{NO}_3$ ), occurs abundantly on the surface of the soil in Peru. It derives its name from its cube-like rhombohedrons. In most cases it resembles ordinary nitre, but in its greater deliquescence, it cannot be used for that salt in the preparation of gunpowder, as it is considerably cheaper than the potash-salt. It is often substituted for it in the manufacture of nitric and sulphuric acids; and it is used as a top-dressing for wheat. Several experiments it has been found that one per acre has produced an increase of

# NITRIC ACID—NITRO-BENZOL.

crystals of nitrate of silver, the reaction being exhibited in the equation :

It is a very unstable compound, and sometimes explodes spontaneously. It dissolves in water with evolution of much heat, and forms hydrated nitric acid.

*Hydrated Nitric Acid* (symb.  $\text{HO}, \text{NO}_3$ , equiv. 63, sp. gr. 1.521), when perfectly pure, is a colourless limpid, fuming, powerfully caustic fluid, possessing an intensely acid reaction, as shewn by its action on litmus. It boils at  $184^\circ$ , and freezes at about  $-40^\circ$ . It parts very readily with a portion of its oxygen to most of the metals, and hence is much used in the laboratory as an oxidising agent. Its mode of action on the metals requires a few remarks. In order that a metal should unite with nitric, or any other acid, it is necessary that it should be in the form of an oxide. This oxidation is, however, effected at the same time that the metal and nitric acid are brought in contact, by one portion of the latter becoming decomposed and converting the metal into an oxide, while the remaining portion combines with the oxide thus formed, to produce a nitrate. The exact nature of the decomposition varies in the case of different metals.

Nitric acid, whether in the concentrated or in a more dilute form, acts energetically on organic matters. As examples of such actions we may refer to its power of decolorising indigo; of staining the skin and all albuminous tissues of a bright-yellow colour; of coagulating fluid albumen; and of converting cotton fibre into an explosive substance. See GUN COTTON.

The monohydrated acid ( $\text{HO}, \text{NO}_3$ ) is by no means a stable compound. If it be exposed to the action of light it is decomposed into hyponitric acid ( $\text{NO}_2$ ) (the peroxide of nitrogen of Graham) and oxygen; and mere distillation produces a similar effect. When it is mixed with water it emits a sensible amount of heat, owing to the formation of a much more stable hydrate,  $\text{HO}, \text{NO}_3 + 3\text{Aq}$ , which distils at  $250^\circ$  without change, and is unaffected by exposure to light. Its specific gravity is 1.424; and it is found that a weaker acid when heated parts with its water, and a stronger acid with its acid, till each arrives at this density. The existence of this hydrate has, however, been recently called in question by Roscoe.

The so-called *Fuming Nitric Acid* is merely a mixture of the pure acid with hyponitric acid.

Nitric acid does not occur naturally in a free state; but it is found tolerably abundant in combination with potash, soda, lime, and magnesia; and after thunderstorms traces of it, in combination with ammonia, are found in rain water. It may be formed in small quantity by passing a series of electric sparks through a mixture of its component gases in the presence of water, which is a mere imitation, on a small scale, of the mode in which it is produced in the atmosphere by a storm. It is usually prepared in the laboratory by the application of heat to a mixture of equal weights of powdered nitre (nitrate of potash) and oil of vitriol (hydrated sulphuric acid) placed in a retort. A combination of sulphuric acid and potash remains in the retort, while the nitric acid distils over, and is condensed in the receiver, which is kept cool by the application of a wet cloth. The reaction is explained by the equation :

During distillation red fumes appear, arising from the decomposition of a portion of the nitric acid and

a formation of some of the lower oxides of nitrogen. In this operation two equivalents of oil of vitriol are taken for one of nitre, these being the proportions found by experience to be most suitable. If they are taken, equivalent for equivalent, a very impure red fuming acid is the result. In the manufacture of nitric acid on the large scale, the glass retort is replaced by a cast-iron cylinder coated with fire-clay, and the receiver by a series of earthen condensing vessels connected by tubes; and nitrate of soda, found native in Peru, is substituted for nitre, in consequence of its being a cheaper salt, and of its containing 9 per cent. more nitric acid.

Nitric acid combines with bases to form *nitrates*, some of which, as those of potash, soda, oxide of ammonium, silver, &c., are anhydrous, while others combine with a certain number (often six) equivalents of water of crystallisation. Most of them are soluble in water, crystallisable, and readily fusible by heat; and at an elevated temperature they are all decomposed, usually leaving only the oxide of the metal. If paper be soaked in a solution of a nitrate, allowed to dry, and ignited, it burns in the smouldering mode characteristic of *touch-paper*. This property is, however, shared by a few other salts.

The tests for this acid when it is present in small quantities are less satisfactory than those for the other ordinary mineral acids. All its compounds are so soluble that no *precipitant* for this acid is known. The best method for its detection is mixing the fluid to be tested with a little concentrated sulphuric acid, and then pouring a strong solution of protosulphate of iron upon it, so as to form a separate layer. If much nitric acid be present, a black colour is produced; if only a small quantity is present, the liquid becomes reddish-brown or purple; the dark colour being due to the formation of nitric oxide by the deoxidising action of a portion of the iron salt on the nitric acid.

The applications of this acid in the arts, in manufactures, and in chemical processes are very extensive.

**NITRIC ACID, THE MEDICINAL USES OF.** In the British pharmacopœia there is both a strong and a dilute acid. The strong acid has a specific gravity of 1.5, and is represented by the formula  $3\text{HO}, 2\text{NO}_3$ , while the diluted acid is prepared by mixing two ounces of the former with thirteen of distilled water, and has a specific gravity of 1.101.

The dilute acid is used internally as a tonic in conjunction with bitter infusions. In many cases of chronic inflammation of the liver, and in syphilitic cases in which the employment of mercurials is inadmissible, it may be prescribed with great benefit, either alone or in conjunction with hydrochloric acid, externally as a bath or lotion, or internally in doses of about 20 minims properly diluted. The strong acid is useful as an escharotic; as to destroy warts, some kinds of polypi, the unhealthy tissue in sloughing ulcers, &c., and as an application to parts bitten by rabid or venomous animals. Largely diluted, as 50 or 60 drops of the strong acid to a pint or more of water, it forms an excellent stimulative application to torpid ulcers.

**NITRO-BENZOL, or NITRO-BENZIDE** ( $\text{C}_7\text{H}_5\text{NO}_2$ ), is a yellow oily fluid, of specific gravity 1.2, which may be distilled without decomposition, crystallises in needles at  $37^\circ$ , and boils at  $315^\circ$ . It has a sweet taste, is insoluble in water, but dissolves freely in alcohol and ether. Its odour is very similar to that of oil of bitter almonds, which has led to its use in perfumery, under the name of *Essence of Nirbane*. It is obtained by treating benzol ( $\text{C}_6\text{H}_6$ ) with warm fuming nitric acid, when

## NITROUS ETHER—NIVERNAIS.

*Nitric Acid* is described in a special article.

Nitrogen combines with hydrogen in four proportions, but none of these compounds can be formed by the direct union of the component elements, and only one of them, viz., ammonia, has been obtained in the isolated form. They are—*Imidogen* ( $\text{NH}$ ), *Amidogen* ( $\text{NH}_2$ ), *Ammonia* ( $\text{NH}_3$ ), and *Ammonium* ( $\text{NH}_4$ ). Of these, the first two will be noticed in the article ORGANIC BASES, while the two last are sufficiently described in the article AMMONIA.

Nitrogen combines with chlorine, bromine, and iodine. The *chloride of nitrogen* is a heavy, oily, orange-coloured fluid, insoluble in water, and evolving a vapour of a highly irritating nature. It is one of the most dangerous compounds known in chemistry, as it explodes with extreme violence when brought in contact with phosphorus, arsenic, potash, ammonia, caoutchouc, numerous oily matters, &c., at ordinary temperatures, and spontaneously when heated to above  $200^\circ$ . It has occasioned so many serious accidents that we shall omit all details regarding its mode of preparation. Its exact formula is unknown. *Bromide of Nitrogen* is an oily-looking detonating liquid, resembling the chloride in appearance and properties. *Iodide of Nitrogen* occurs as a black powder, which when dry explodes upon the slightest touch, and often without any assignable cause.

Nitrogen enters into combination with various metals, as mercury, copper, titanium, molybdenum, and vanadium, forming a class of compounds to which the term *Nitrides* is applied. Their most marked characteristic is, that, like the preceding set of compounds, they are highly explosive, resolving themselves when struck, or at a high temperature, into their constituent elements.

**NITROUS ETHER, or NITRITE OF OXIDE OF ETHYL**, is represented by the formula  $\text{C}_2\text{H}_5\text{O.N.O.}$ , or  $\text{AeO.N.O.}$ , Ae being the symbol for ethyl ( $\text{C}_2\text{H}_5$ ). It is a pale yellow fluid, having a specific gravity of 0.947, and evolving an agreeable odour of apples. On evaporation, it produces a great degree of cold, it boils at  $62^\circ$ , and it is very inflammable. It does not mix with water, but is readily miscible with alcohol. When kept in contact with water it soon decomposes, and an acid mixture of a very complicated character is formed. It may be obtained by mixing 1 part of starch and 10 of nitric acid in a capacious retort, which must be gently heated. The vapour of nitrous acid, which is evolved by the action of the starch on the nitric acid, is conducted into alcohol, mixed with half its weight of water, contained in a two-necked bottle, which is to be plunged into cold water. The second neck of this bottle is connected with a good cooling apparatus; and the vapour combining in its passage through the alcohol with the oxide of ethyl, forms nitrous ether, which distills in a continuous stream. This, which is known as Liebig's method, is the best process, but it is usually prepared by the direct action of nitric acid on alcohol, in which case the nitric acid is deoxidised by the hydrogen and carbon of the ethyl of part of the alcohol.

The *Spirit of Nitrous Ether*, or *Sweet Spirit of Nitre*, used in medicine, is a mixture of nitrous ether with about four times its volume of rectified spirit. Its specific gravity should not exceed 0.85. It is used, in conjunction with other medicines, as a diuretic, especially in the dropsy which follows scarlatina; and it is employed, in combination with acetate of ammonia and tartarised antimony, in febrile affections. The dose in febrile cases is from half a drachm to a couple of drachms, and if we wish it to act as a diuretic, two or three drachms should be given. It is a rather expensive medicine,

and consequently is extremely liable to adulteration. In the new British Pharmacopœia, it is recommended that this substance should be directly obtained by the distillation of nitrite of soda (five ounces), sulphuric acid (four fluid ounces), and rectified spirit (two pints)—a process open to many practical objections.

**NITZSCH, KARL IMMANUEL**, one of the most distinguished theologians that modern Germany has produced, was born September 21, 1787, at Borna. He studied for the church at Wittenberg, where he took his degree in 1810, and where, in 1813, he became parish minister. Here his religious opinions underwent a great modification, through the influence of Schleiermacher and Daub, and he awoke to a clearer perception of the essence of religion. From this time forward N. is to be regarded as one of that new school—of which Neander is the greatest representative—who endeavoured to reconcile faith and science, not by forced and unnatural methods, but by pointing out their distinctive spheres, and by exhibiting in their own spiritual life that union of reason and reverence for which they argued in their writings. In 1822, N. was called to Bonn as ordinary professor of theology and university preacher, where he laboured with great diligence for more than twenty years, not only in theology, but in all matters affecting the welfare of the Prussian church. In 1847, he succeeded Marheineke at Berlin, and as professor, university preacher, and upper consistorial councillor, he has exercised with prudence and moderation a wide ecclesiastical influence. In his political (perhaps also in his religious) views he may be classed with the late Chevalier Bunsen. The High Lutheran party having denounced liberal politics as irreligious, N. and Bunsen and others have vindicated them on the ground of Christianity, not without success. In theology, his position will be best understood when we say that he subordinates dogma to ethics, or rather that he believes the only dogmas which can hope to permanently maintain themselves are those that result from an ethical apprehension of Christianity. Besides numerous smaller treatises on Dogmatics, the History of Dogmas and Liturgies, three larger works call for special mention. These are his *System der Christlichen Lehre* (Bonn, 1829; 6th edit. 1851); his *Praktische Theologie* (Bonn, 1847—1848); and his *Predigten*, or Sermons, of which several collections have appeared, and which are remarkable for their extraordinary richness of thought.—**NITZSCH, GREGOR WILHELM** (born in 1790), brother of the preceding, has acquired a high reputation as a philologist, and is now professor of archæology at Leipzig. He is considered one of the ablest opponents of Wolf's Homeric theories. His chief work is *Die Sagenpoesie der Griechen* (Brunswick, 1852).

**NIVELLES** (Flem. *Nyvel*), a town of Belgium, in the province of South Brabant, 18 miles south of Brussels. It has a fine church, called the Church of St Gertrude (built in the Romanesque style of architecture, 1048 A.D.), which claims to contain the relics of St Gertrude, daughter of Pepin, Maire du Palais. They are deposited in a shrine placed over the high-altar. N. has manufactures of linen, cotton, lace, &c. Pop. 8830.

**NIVERNAIS**, formerly a province in the middle of France, nearly corresponding to the present department of Nièvre. It was divided into eight territorial districts, and its towns enjoyed municipal privileges at a very early period. The principal landowners were the counts, afterwards dukes, of Nevers, who held under their vassalage more than 1800 fiefs.

## NOBILITY.

oath of fealty to himself; and his successors altogether abolished subinfeudation.

The military tenant, who held but a portion of a knight's fee, participated in all the privileges of nobility, and an impassable barrier existed between his order and the common people. Over continental Europe in general, the nobles, greater and lesser, were in use, after the 10th c., to assume a territorial name from their castles or the principal town or village on their demesne; hence the prefix 'de,' or its German equivalent 'von,' still considered over a great part of the continent as the criterion of nobility or gentility. Britain was, to a great extent, an exception to this rule, many of the most distinguished family names of the aristocracy not having a territorial origin. See NAME.

Under the feeble successors of Charlemagne, the dukes, marquises, and counts of the empire encroached more and more on the royal authority; and in course of time, many of them openly asserted an independence and sovereignty with little more than a nominal reservation of superiority to the king. By the end of the 9th c., the Carolingian empire had been parcelled into separate and independent principalities, under the dominion of powerful nobles, against whom, in Germany, the crown never recovered its power. In France, however, the royal authority gradually revived under the Capetian race, the great fiefs of the higher nobility being one by one absorbed by the crown. In England, where the subjection of the feudal aristocracy to the crown always was, and continued to be a reality, the resistance of the nobles to the royal encroachments was the means of rearing the great fabric of constitutional liberty. All those who, after the Conquest, held *in capite* from William belonged to the nobility. Such of them as held by barony (the highest form of tenure) are enumerated in *Domesday*. Their dignity was territorial, not personal, having no existence apart from baronial possession. The *comes* was a baron of superior dignity and greater estates; and these were in England the only names of dignity till the time of Henry III. The rest of the landholders, who held by other tenures than barony, also belonged to the nobility or gentry.

After the introduction of Heraldry, and its reduction to a system, the possession of a coat-of-arms was a recognised distinction between the noble and the plebeian. In the words of Sir James Lawrence (*Nobility of the British Gentry*): 'Any individual who distinguishes himself may be said to ennoble himself. A prince judging an individual worthy of notice, gave him patent letters of nobility. In these letters were blazoned the arms that were to distinguish his shield. By this shield he was to be known or *nobilis*. A plebeian had no blazonry on his shield, because he was *ignobilis*, or unworthy of notice. Hence arms are the criterion of nobility. Every nobleman must have a shield of arms. Whoever has a shield of arms is a nobleman. In every country of Europe without exception, a grant of arms, or letters of nobility, is conferred on all the descendants.' On the continent, the term noble is still generally used in this sense; in England, it is now more common to restrict the words noble and nobility to the five ranks of the peerage constituting the greater nobility, and to the head of the family, to whom alone the title belongs. Gentility, in its more strict sense, corresponds to the nobility of Sir J. Lawrence and of continental countries. This difference of usage is a frequent source of misapprehension on both sides of the Channel; at some of the minor German courts, the untitled member of an English family of ancient and distinguished blood and lineage has

sometimes been postponed to a recently-created baron or 'Herr von,' who has received that title, and the gentility accompanying it, along with his commission in the army. It has been taken for granted that the latter belongs to the 'Adel' or nobility, and not the former.

The original higher nobility of Germany consisted of the dynasty nobles, i.e., the electoral and princely houses of the realm, with those counts and barons who had a seat in the diet or estates of the realm. These last have, since 1815, all been elevated to higher titles; most of the counts, in recompense for their acquiescence in the abolition of the German empire, receiving the diploma of prince, a title to which our dukes, marquises, and earls have also an undoubted right. The lower German nobility, corresponding to our gentry, were the merely titular Counts and Barons (i.e., those who had no seat in the Diet), the Edel-herren and Banner-herren (something like our Bannerets), the Knights of the Holy Roman Empire, the 'Edlen von' (who now take the style of baron), and the common nobles distinguished only by the prefix 'von.' Throughout the middle ages, the lesser nobility of Britain preserved a position above that of most continental countries, being, unlike the corresponding class in Germany, allowed to intermarry with the high nobility, and even with the blood-royal of their country.

The higher nobility, or nobility in the exclusive sense, of England, consist of the five temporal ranks of the peerage—Duke, Marquis, Earl, Viscount, and Baron (in the restricted signification of the word), who are members of the Upper House of Parliament. Formerly, all the barons or tenants-in-chief of the sovereign were bound to attend his councils; but after the reign of Edward I., only a select number of them were summoned, the rest appeared by representatives—the former were considered the greater, the latter the lesser barons. See MINOR BARONS. In Scotland, the whole barons continued to sit in parliament till a much later period; and after the minor barons attended only by representatives from their body, these representatives sat in the same house with the greater nobility, and up to the Union, their votes were recorded as those of the 'small barrounis.' By the Act of Union between England and Scotland, the Scotch peers elect 16 of their number to represent their body in the House of Lords in each parliament. The peers of Ireland, in virtue of the Irish Act of Union, elect 28 of their number to sit in the House of Lords for life. The Act of Union with Scotland has been understood to debar the sovereign from creating any new Scotch peerages; all peers created in either England or Scotland between that date and the union with Ireland are peers of Great Britain; and peers created in any of the three kingdoms subsequently to the union with Ireland are peers of the United Kingdom, with this exception that one new peerage of Ireland may be created on the extinction of three existing peerages. When the Irish peers are reduced to 100, then, on the extinction of one peerage another may be created. All peers of Great Britain or of the United Kingdom have a seat in the House of Lords. A Scotch peer, though not one of the sixteen representative peers, is debarred from sitting in the House of Commons, a disability which does not attach to Irish peers. The peerage is, from time to time, recruited by new additions, the persons selected being in general peers of Scotland or Ireland; younger members of the families of peers; persons distinguished for naval, military, political, or diplomatic services; eminent lawyers promoted to high judicial appointments; persons of large property and ancient family,

## NOBILITY—NODAL POINTS.

Colonnas, Dorias, Odescalchi, &c., from royal or imperial erection; and in other instances—as the Caetani and Massimi—from investiture by the pope as a temporal sovereign. 2. Marquis and Count; many of these are provincial nobles, with titles generally derived from small feudal tenures, of which, in some instances, it would be difficult to shew the diploma, or point out the period of creation. In some parts of the Papal States it is understood that every head of a noble house is a marquis; and in the March of Ancona, Sixtus V. conferred the right to bear the title of count on all who were of noble blood at the period. 3. Knights (*Cavalieri*), a designation given to all who wear a Roman order, to Knights of Malta, and generally to younger sons of the titled nobility. 4. Princes, who, with the sanction of the pope, have purchased honours along with ancient fiefs, that carried with them ducal or princely titles, most of them *novi homines*, as the Torlonias. Titles do not descend to the younger members of the family; it is the general usage for the head of the house to bear the most ancient title, while the eldest son, on his marriage, assumes the second in point of antiquity. The title is sometimes the family name, sometimes the name of a feudal possession. The proper designation of the younger branches of titled families is 'dei Principi,' 'dei Duchi,' 'dei Marchesi,' &c.

The nobility of Spain boasts of a special antiquity and purity of blood, a descent from warriors and conquerors alone, without the infusion of any of the elements derived from the church, law, and commerce that are to be found in other countries. 'Hidalgo' (*hijo d'algo*, son of somebody, not *filius nullius*) is a term which implies gentility or nobility. The hidalgo alone has in strictness a right to the title 'Don,' which, like 'Sir' of our knights and baronets, requires the adjunct of the Christian name. When the Christian name is omitted, the title 'Señor' instead is prefixed with the addition of 'de.' 'Don' has latterly been used by persons who have no proper claim to it about as extensively as 'Esquire' in England. *Hidalguia*, till recently, conferred important privileges and immunities. The higher nobility are styled *Grandees*; formerly, the title was '*rico ombria*,' and the ceremonial of creation consisted in granting the right of assuming the pennon and caldron (*peñon y caldera*)—the one the rallying ensign of command, the other of maintenance of followers. In contradistinction from the grandees, the class of nobility below them are called '*los Titulados de Castilla*.' Red blood is said to flow in the veins of the hidalgo, blue in that of the grandee. Formerly, there were three classes of grandees, whose mark of distinction was this—that a grandee of the first class was entitled to put on his hat in the royal presence before the king spoke to him; the second, after the king spoke to him; the third, after the king had spoken and he had replied. The second and third classes are now absorbed into the first. Of the grandees, some bear the title of duke, some of marquis, some of count; but it is the ambition of every grandee to unite in himself as many grandeeships, or have as many *hats*, as the phrase is, as he can. This is effected by the marriage of heiresses through whom *grandeza* descends, and whose names and titles are assumed by their husbands. An enormous accumulation of titles is sometimes found in the person of one grandee. Titles as well as estates go only to heirs of entail. The titulars of Castile are designated '*vuestra señoría*;' in common parlance, '*ucía*.' The title of Baron is little used in Spain. Physically and mentally, the grandees have degenerated from their ancestors, and they have not the influence at court and in the country which landed property

ought to give them. Most of them reside at Madrid, clinging to their nominal rank and real nullity, while they are practically excluded from all the functions of state.

In Russia, what nobility existed before Peter the Great was of a patriarchal not a feudal kind; but in his anxiety to assimilate everything to a western standard, the czar took the existing aristocracies of states quite differently situated as the model to which to approximate the fortunate of his own subjects. The Russian nobles have ever since been enlarging their privileges by encroachments on those under them. Before Moscow was burned, the mass of the nobles connected with the court lived there in great splendour, and along with their domestic serfs constituted half the population of that city.

The preservation of noble blood, untainted by plebeian intermixture, has often been reckoned a matter of much moment. In Spain most of all, this purity of lineage has been jealously guarded. In the German empire, no succession was allowed to feus holding immediately of the emperor, unless both parents belonged to the higher nobility. In France, the offspring of a gentleman by a plebeian mother was noble in a question of inheritance or exemption from tribute, but could not be received into any order of chivalry. Letters of nobility were sometimes granted to reinstate persons in this position. It is in Germany still important for many purposes to possess eight or sixteen quarterings, i. e., to be able to shew purity of blood for four or five generations, the father and mother, the two grandmothers, the four great-grandmothers; and also, in case of the sixteen quarterings, the eight great-great-grandmothers, having all been entitled to coat-armour. Among the higher grades of the peerage in England, a considerable number may be pointed out who do not possess this complete nobility. It is in Scotland more usual and more regarded, both among peers and untitled gentry, where the eight or sixteen quarterings are still in use to be displayed on the funeral escutcheon. At some of the minor German courts, the sixteen quarterings were not unfrequently an illusion, diplomas being granted in the absence of a full pedigree, to declare the parties as noble as if they had sixteen ancestors.

**NOCERA**, or **NOCERA DEI PAGANI**, a town of South Italy, in the province of Salerno, eight miles north-west of the town of Salerno, and on the highway from that town to Naples. It carries on linen and woollen manufactures. Pop. 6399.

**NOCTURN** (Lat. *nocturnum*, recited 'by night'). Under the head **BREVIARY** (q. v.) has been explained the general order of the services of the canonical hours, in the Roman Catholic Church. The service of **MATINS** on Sundays and festivals is divided into three nocturns, each of which consists of three (or more) psalms and three *lessons*. The lessons are either from the Scriptures, from the life of a saint, or from a homily of some Father. The name is derived from the recitation of the service 'by night.'

**NODAL POINTS, LINES, AND SECTIONS.** When a string or metallic cord, under strong tension, is made to vibrate, we hear, besides the principal sound, several secondary and shriller sounds; these are denominated harmonic sounds, and are produced each by a certain portion of the chord which vibrates independently. Further investigation has shewn that every vibrating string is divided into a number of portions alternately vibrating in opposite directions, and that the points which separate these portions from each other are at rest. These points are

## NODES—NOLLEKENS.

**NODES** are swellings, most commonly of an oblong form, which occur on superficial bones, such as the tibia, ulna, clavicle, and frontal bone, and are due to a syphilitic taint, to scrofula, or to rheumatism. Their immediate cause is the infiltration of lymph or serum into the periosteum, or between it and the bone. The treatment depends so essentially on the constitution of the patient, and the primary cause of the swelling, that it would be inexpedient to enter into any detail regarding it.

**NODIER, CHARLES E.**, an eminent French litterateur, was born at Besançon, 29th April 1783; other authorities give 1780 and 1781. His father was a distinguished lawyer, who warmly embraced the side of the revolution, and brought up his son in the same principles. At the age of 12, he was a member of the famous society of *Amis de la Constitution*, and hated tyranny with a most ideal and classical hatred; but he soon afterwards became a royalist; then, again under Napoleon, a republican; and indeed during his whole career shewed a want of that robust opinionativeness, without which it is impossible for a man to become a genuine politician. He died—after a life of the hardest literary work, in which time, and even admirable talents were wasted on inferior subjects—27th January 1844. Besides editions of the French classics, grammatical, lexicographical, and poetical works, he wrote numerous tales and memoirs. A portion of his writings was collected and published in 12 vols. at Paris, 1832—1834, under the incorrect title of *Œuvres Complètes*.

**NOETIANS.** See **PATRIPASSIANS**.

**NOGENT LE ROTROU**, a town of France, in the department of Eure-et-Loir, is situated in a pretty vale on the Huisne, 32 miles west-south-west of Chartres. It is a station on the Great Western Railway from Paris to Rennes in Brittany. Pop. (1872) 7056. N. is a long, well-built town, with a ruined castle in the Gothic style, the residence of the great Sully.

**NOGGING.** Brickwork built in the panels of a timber-framed house. Nogging-pieces are horizontal timbers, introduced to strengthen the brickwork.

**NOILS**, a technical term employed for the short and broken hairs which are removed from wool in the process of combing and preparing it for worsted manufactures. The *noils* are used for making inferior yarns, and are valuable for *felting* purposes, in which they are largely employed.

**NOLA**, an episcopal city of South Italy, in the province of Caserta, 16 miles east-north-east of Naples, is built on the site of one of the oldest cities of Campania. The ancient N. was founded by the Ausonians, and fell into the hands of the Romans in the Samnite war, 313 B.C. For its protection, Marcellus in the second Punic war fought in its vicinity the first battles in which the Romans were victorious over Hannibal. Augustus died at Nola, 14 A.D. The first bells for Christian churches are said to have been cast here in the 5th century. See **BELL**. Numerous coins, and beautiful vases made of a pale-yellow clay, with figures painted in crimson and maroon, and supposed to have been manufactured here by potters from Corinth, have been found in the vicinity. N. was a flourishing city in the middle ages, and has at present 12,030 inhabitants.

**NOLI ME TANGERÉ**, a popular name for one form of the disease which has been already described under the term *Lupus* (q.v.).

**NOLLÉ PROSEQUI**, a term used in English Law to denote that the plaintiff does not intend to

go further with the action, or part of the action, in which case he enters or files a memorandum, called a *nolle prosequi*, after which the action, or part of the action, is at an end on that point, and the defendant is entitled to his costs thereon.

**NOLLEKENS, JOSEPH**, was born in London in 1737. His father, who was from Antwerp, and by profession a painter, died when he was young, and his mother, a Frenchwoman, not remaining long a widow, he received but little education. Being placed in the studio of Scheemakers the sculptor, in Vine Street, Piccadilly, he worked hard, and made such progress, that, in 1759, the Society of Arts awarded him fifteen guineas for a group in clay; in 1760, thirty guineas for a bas-relief; and during the same year, ten guineas for a model in clay of a dancing faun. Soon after this, N. set out for Rome. He was then in his twenty-third year; his purse was light, he had no patron to support him; but he was independent in spirit, and had been trained to habits of economy. A bas-relief he carved in stone brought him ten guineas from England, and the Society of Arts voted him fifty guineas for his group in marble of Timoclea before Alexander. But one of the most important events for him, after settling in Rome, was his meeting Garrick in the Vatican, who immediately recognised his countryman as the young sculptor to whom the prizes had been awarded by the Society of Arts, sat to him for his bust, and paid him handsomely for it. This was the first bust he had been commissioned to model, and it gave him the opportunity of proving where his strength lay. He also executed in Rome a bust of Sterne in terra cotta, which added greatly to his reputation. After residing ten years in Rome, he returned to London, took a lease of extensive premises in Mortimer Street, where he set up his studio; and the reputation he had acquired in Rome was such, that he immediately had full employment, and within a year after (in 1771) was elected an Associate of the Academy, and a Royal Academician the following year. His forte was in modelling busts. Into these he infused much truth and character, and he has handed down the likenesses of most of the important personages who figured in this country in the end of the last and at the commencement of this c.—of Samuel Johnson, who was his friend and frequent visitor—of Fox, Pitt, and other political characters. George III. also sat to him; and his manner, which exhibited pretty strongly what is popularly set down as blunt and manly English character, made him a great favourite with the king. Besides busts, N. executed numerous commissions for public monuments and statues. He was selected by the Academy, with whom the choice lay, to execute the government commission of a monument to the three captains, Manners, Bayne, and Blair, who fell in Rodney's great battle of April 12, 1782; but in this he did not rise above the allegories of Neptune and his Sea-horse, and Britannia and her Lion. His statue of Pitt for Cambridge was much praised at the time. He also executed, either in the course of his studies, or to meet the views of those connoisseurs who advocate high art, a considerable number of classical and mythological statues and groups, a faun, a Bacchus, five Venuses, Cupid and Psyche, Pætus and Arria, &c. He died in London, 23d April 1823. His wife, to whom he had been long married, and who had brought him some fortune, died a few years before him. He had no children, and his great wealth, upwards of £200,000, was left to certain friends, burdened with some legacies and annuities to his old assistants and servants.—See *Cunningham's Lives of British Artists*, &c.

## NONCONFORMISTS—NOOSSA.

officers are termed *sous-officiers*; in Germany, *unter-offizieren*.

**NONCONFORMISTS**, a name sometimes given generally to all sectaries who, at any period in English history since the establishment of Protestantism, have refused to conform to the doctrine and practices of the Episcopal Church. It is, however, more frequently used in a restricted sense to denote the 2000 clergymen who in 1662—two years after the Restoration—left the Church of England, rather than submit to the conditions of the Act of Uniformity, which required of every beneficed minister, every fellow of a college, and even every schoolmaster, unfeigned assent to all and everything contained in the Book of Common Prayer. The ejected ministers swelled the ranks of the Presbyterians and Independents, the latter of whom are sometimes called Nonconformists.

**NON-EFFECTIVE** (Fr. *non-actifs*), is the term applied to the portion of the personnel of the army or navy not on active service or in immediate readiness for active service. It thus comprises all officers on retired or half-pay, pensioners, and superannuated officers. In a force liable to frequent augmentations and reductions, the non-effective charge must be considerable, and a large retirement is necessary, in order to rapid promotion. The great French war, also, with the reductions following it, bequeathed to the British an annual non-effective charge of several millions, which is not yet wholly expunged. At present (1874—1875), the non-effective charges are £2,187,500 for the army, and £1,815,926 for the navy, being 16·7 per cent. on the gross cost of the two services.

**NON-ENTRY**, in the Law of Scotland, means that state of a feudal estate when the last vassal has died, and his successor has not been invested or seised of the land. On such an occasion, the superior is entitled to what is called a casualty of non-entry, which consists of the rent of the feu.

**NON EST INVENTUS**, a technical term used in that part of the law where, after judgment, the sheriff endeavours to arrest a party. If after a reasonable search he cannot find the debtor, he makes a return to the court that he has not been able to find the debtor, which is shortly called a return of *non est inventus*, and his duty is then discharged until a fresh writ is issued to him.

**NONE** (Lat. *nona*, 'ninth'), one of the lesser Canonical Hours (q. v.), so called from its recitation being primitively fixed at the ninth hour.

**NONES**. See **CALENDS**.

**NONFEA'SANCE**, in certain parts of the Law of England, means the not doing what one is bound to do.

**NONJOINDER**, in English Law, is the omitting to join all the parties to the action or suit.

**NONJURORS**, the name given to that portion of the Episcopal clergy of England who at the coronation of William and Mary refused to take the oath of allegiance to these sovereigns, believing that they had unlawfully possessed themselves of the throne abdicated by James II. They were great champions of the doctrine of passive obedience on the part of subjects towards kings; and as the triumph of the Prince of Orange was obtained at the expense of that doctrine, it was impossible that they could, consistently with their antecedents, acknowledge him as their rightful king. The House of Commons allowed them six months longer than laymen to make up their minds, but declined to adopt the amendment of the Lords, viz., that the oath should not be imposed on the clergy. They refused, and were consequently deprived of their

sees and benefices. The nonjurors comprised Archbishop Sancroft, 8 bishops, and about 400 of the inferior clergy.

**NON-RESIDENCE**, the name given in Church Law to the offence of a person holding a Spiritual Benefice who absents himself without legal justification from the local precincts within which the duties attached to the benefice are prescribed to be performed. The obligation of residence follows clearly from every principle of law, and from the constant tendency to relaxation on the part of the clergy, has been an unfailing subject of legislation, ecclesiastical and civil, from the very earliest times. The Council of Nice in 325, of Antioch in 332, and of Carthage in 401; the constitutions of the popes from the earliest genuine document of that class, the novels of Justinian, the capitularies of Charlemagne—all speak the same language, and enforce it by the same penalties. During the medieval period, and especially during the unhappy contests of the western schism, great abuses prevailed. The whole substance of the legislation of the Roman Church on the subject, however, is compressed in the decrees of the Council of Trent, which are mainly contained in the decrees of the XXII. and following sessions, 'On Reformation.' The decrees of the council regard all church dignitaries, and others charged with the cure of souls. Without entering into the details, it will suffice to say, that for all the penalty of absence without just cause, and due permission, consists in the forfeiture of revenues, in a proportion partly varying with the nature of the benefice, partly adjusted according to the duration of the absence. For each class, moreover, a certain time is fixed, beyond which, during twelve months, absence cannot be permitted. The duty is imposed on persons named in the law of reporting to the ecclesiastical superiors cases of prolonged absence. The same legislation has been confirmed by most of the recent concordats, and is enforced by the civil law of each country. In England, the penalties for non-residence are regulated by 1 and 2 Vict. c. 106. Under this act, an incumbent absenting himself without the bishop's licence for a period exceeding three, and not exceeding six months, forfeits one-third of the annual income; if the absence exceed six, and does not exceed eight months, one-half is forfeited; and if it be of the whole year, three-fourths of the income are forfeited. The persons excused from the obligation of residence by the canon law are sick persons, persons engaged in teaching the theological sciences in approved places of study, and canons in immediate attendance upon the bishop ('*canonici a latere*'), who ought not to exceed two in number. By the act 1 and 2 Vict. c. 106, heads of colleges at Oxford and Cambridge, the wardens of Durham University, and the head-masters of Eton, Westminster, and Winchester Schools are generally exempted, and temporary exemptions from residence are recognised in other cases, which it would be tedious to detail. In the Roman Catholic Church, besides the general legislation, most of the provincial and diocesan statutes contain special provisions on the subject of non-residence.

**NON-SUIT** is a legal term in England, which means, that where a plaintiff in a jury trial finds he will lose his case owing to some defect or accident, he is allowed to be non-suited, instead of allowing a verdict and judgment to go for the defendant. The consequence is, that the plaintiff has to pay the defendant's costs; but he can bring a fresh action, if he can get over the difficulty that rendered a non-suit necessary or expedient.

**NOOSSA**. See **MOLUCCAS**.

## NOOTKA DOG—NORFOLK.

**NOOTKA DOG**, a large kind of dog, common in a domesticated state among the natives of the vicinity of Nootka Sound. It has erect, pointed ears. It is chiefly remarkable for the extreme abundance of its long woolly hair, which, when shorn off, holds together as a fleece, and is spun and woven into garments. The introduction of this wool-bearing dog into other countries has been suggested, but not yet attempted.

**NOOTKA SOUND**, an inlet on the west coast of Vancouver's Island, British North America, in lat. 49° 35' N., long. 126° 35' W. Its entrance is protected by an island of the same name, and the Sound can be entered on both sides of the island. It extends inland for 10 miles in a north-north-east direction; but the greatest breadth of water is not more than 500 yards. Numerous small coves and inlets are found around the rocky shores. It affords good anchorage.

**NORD**, the most northerly department in France (whence its name), corresponding with the former province of French Flanders, and bordering on Belgium and the Straits of Dover. Area, 1,420,000 acres; pop. (1872) 1,447,764. It is composed of two parts, or at least narrows near the middle at Armentières, on the Lys, almost to a line. It is watered by the Scheldt and the Sambre, with their affluents, and by numerous canals. Next to that of the Seine, it is the most densely peopled department in France. The soil is fertile, well cultivated, and yields more abundant harvests than any other part of the country: 883,606 acres are arable. The principal products are wheat, hemp, beet-root, vegetables, tobacco, and fruits. Manufactures of lace, cambric, linens, and beet-root sugar are extensively carried on. It has a much larger proportion of railways, roads, and canals than any of the other departments, as well as the most important coal and iron mines. No other department has so many populous towns and strong fortresses; none adds so much to the national revenue; in none are the people so intelligent, so susceptible of culture, or so industrious. In respect of its educational and benevolent institutions, as well as of its learned societies, it ranks next to the department of the Seine. The arrondissements are Lille, Douai, Cambrai, Valenciennes, Avesnes, Hazebrouck, and Dunkerque. The chief town is Lille.

**NORDERNEY**, a small island of the former kingdom of Hanover, lies three miles off the coast of East Friesland, and forms one of a string of islands that line that coast. Area about 4 square miles; permanent pop. 800. It has enjoyed, since 1797, a great reputation as a place for sea-bathing, and in the summer season has from 1600 to 2000 visitors. The little village at the west end of the island has a very tastefully-built *Conversations-Haus*, 130 feet long. Trees do not grow here.

**NORDHAUSEN**, a flourishing town of Prussian Saxony, pleasantly situated at the southern base of the Harz Mountains, on the Zorge, 33 miles north-north-west of Erfurt. The surrounding country is very fertile in corn, and in the vicinity commences the *Goldene Aue* (Golden Plain), a fertile valley watered by the Helme. It contains a gymnasium, numerous churches, one of which, St Blasius, contains two pictures by Luke Cranach. It carries on a thriving general trade, is the dépôt from which the Harz Mountains are supplied with necessities, and has most extensive distilleries and considerable manufactures of tobacco, succory, chemicals, cloth, leather, &c. Its spirit distilleries, of which there are fifty in almost constant operation, produce annually for export upwards of 100,000 hogsheads of brandy. Pop. (1871) 21,273.

790

**NÖRDLINGEN**, a town in the west of Bavaria, is situated on the river Eger, 44 miles north-west of Augsburg by the Munich and Nürnberg railway. It has a Gothic church, with a high tower and the organ, and manufactures of Tyrolean carpets, laces, and woollens, besides a large trade in feathers. Pop. (1871) 7081. N. is historically interesting as the scene of several battles, the most famous of which was fought, 6th September 1634, between 24,000 Swedes, under Count Horn and Duke Bernhard of Saxe-Weimar, and 45,000 imperialists under King Ferdinand. The former were defeated with the loss of 12,000 killed and wounded, 300 banners and standards, 80 cannons, and several thousand prisoners, among whom was Horn himself.

**NORE** is a sand-bank in the estuary of the river Thames, 4 miles north-east of Sheerness, on which there is a floating light, called the Nore light, in lat. 51° 29' N., long. 0° 48' W. The name, however, is more commonly applied to the portion of the estuary in the vicinity of the Nore light and sand-bank.

**NORFOLK**, a large and important maritime county of England, bounded on the north and north-east by the North Sea, and on the south by the county of Suffolk. Area, 1,356,173 acres; pop. (1871) 433,511. Its coast-line, extending from Yarmouth, on the east, to the mouth of the Nen in the Wash, is about 100 miles in length. From Yarmouth to Happisburgh, the coast is low and sandy; from Happisburgh to Weybourne, it is skirted by low cliffs; and west of Weybourne to the entrance to the Wash, where the banks are in great part dry at low-water, and where a considerable extent of land has been reclaimed from the sea (see WASH), it is low, and covered with sand or shingle. The surface of the county is level, or nearly so, none of the rising-grounds being considered worthy of being called hills. The principal rivers are the Ouse, the Yare, with its affluents the Wensum and the Waveney, and the Bure. Communication is kept up by the navigable rivers, and by the Great Eastern Railway. The climate is affected in spring particularly by cold north-east winds, but the air is in general dry and healthy. The soil consists chiefly of light sands and loams, and comprises a great extent of land, which though naturally not fertile, has been made so by judicious management. The agriculture of the county is in an advanced condition, and all the usual crops are extensively grown; while that of barley is especially celebrated. Half the acreage is devoted to rearing food for cattle, and thus the necessary supply of manure is secured. Geese and turkeys are extensively reared for the London market. The county is divided into three parts, North, South, and West N., each returning two members to the House of Commons. The capital is Norwich.

**NORFOLK**, a city and port of entry of Virginia, U. S., 106 miles south-east of Richmond, and 32 miles from the ocean. The city is irregularly built on low ground, and contains a city hall, military academy, mechanics' hall, court-house, jail, custom-house, 3 banks, 14 churches. Its large deep harbour is defended by Fort Calhoun and Fortress Monroe, the largest fortress in America. A government navy yard, dry dock, and marine hospital are in the suburb of Gosport. N. was built in 1736; in 1776, it was burned by order of Lord Dunmore, the British colonial governor. In 1855, a large number of the inhabitants died of yellow fever. In 1872, the imports of N. (including Portsmouth) amounted in value to 290,128 dollars, and the exports to 888,037 dollars; and, in the same year, the number of vessels belonging to these ports was 344. Pop. in 1870, 19,229.

## NORFOLK ISLAND—NORMAN ARCHITECTURE.

**NORFOLK ISLAND** lies in the Pacific Ocean, 1100 miles east-north-east of Sydney in Australia, in lat. 29° 10' S., and long. 167° 58' E. Length, 5 miles; breadth, 2½ miles; area, 8960 acres. It is the largest of a small cluster of islands, comprising N., Nepean, and Philip Islands, together with several rocky islets. The coasts are high and steep, and the surface generally uneven, rising in Mount Pitt to upwards of 1000 feet in height. The soil is fertile and well watered, and the climate healthy. In 1825, N. I. was made a penal settlement by the British government for the worst class of convicts sent out to New South Wales; but the experiment was a failure, and the establishment was broken up in 1855. In 1856, the inhabitants of Pitcairn Island (q. v.)—194 in number, descendants of the mutineers of the *Bounty*—were transferred hither by the British government. In 1871, the pop. was 481, the Pitcairn community numbering 297.

**NORIC ALPS.** See **ALPS**.

**NORIUM** is the name assigned by Svanberg to a metal, whose earth (or oxide) is associated with zirconia in certain varieties of the mineral zircon. Its existence is not as yet definitely established.

**NORMAL SCHOOLS**, institutions where teachers are instructed in the principles of their profession and trained in the practice of it. The name of Normal School is of French origin (*École Normale*, from Lat. *norma*, a rule or model), and is that generally used in Scotland; such institutions, in England, are oftener called 'Training Colleges;' and in Germany 'Seminaries.' That in acquiring knowledge the mind follows certain processes, and that any one imparting knowledge should do so in harmony with these processes, are truths which seem sufficiently obvious. It is only recently, however, that they have secured much attention; and they are even at this day deliberately denied by some men of thought, and of the highest educational position. The recognition of these truths has, however, been sufficiently extensive to secure the institution, in Great Britain, America, France, Germany, and Switzerland, of schools in which the principles of teaching form the subject of study, and in which model specimens of the art are given. Italy, and even Russia, are following in the wake of the countries named. These schools also afford a thorough course of instruction in the subjects which are taught in elementary schools. The only normal school for training the higher class of teachers for colleges and academies exists in Paris.

One of the earliest, if not the earliest, normal school in Great Britain was the Sessional School of Edinburgh (1830), afterwards developed into the 'General Assembly's Normal Institution.' The first attempt of a similar kind in England was that of the Battersea Training College, instituted by Mr. now Sir J. P. Kay Shuttleworth, and Mr. Tuffnell. Sir J. P. K. Shuttleworth afterwards, acting as secretary to the Committee of Privy Council on Education, suggested measures which have resulted in the institution of 42 colleges for the training of teachers in Great Britain in connection with the Established and Dissenting Churches. These turn out hundreds of male and female teachers annually, who having, after a two years' course of training, received government certificates of merit, become teachers of elementary schools.

There has been for some years a reaction against the necessity of normal schools, and their maintenance at the public expense. But this reaction can only be temporary, and the great facts will survive, that every subject of instruction is best taught according to a certain method, and that all methods are based on the study of the human

mind. This is a position which it is impossible permanently to shake. The real founders of normal schools are those men who, with more or less clearness and width of view, have brought prominently forward these principles. Such were Plato and Quintilian, in ancient times; in more recent years, the most prominent names have been Comenius, Pestalozzi, Rousseau; and, in our own country, Ascham, Milton, Locke, Professor Pillans, and Dr Arnold.

**NORMAN ARCHITECTURE.** As its name implies, this style was originated and chiefly used by the Normans. Soon after their conquest of the north of France, they began to erect churches and cathedrals in memory of their victories. Their conquests supplied them with the means for making these large edifices. They were not contented with the small churches then common in France, but desired to erect monuments worthy of their great conquests. They accordingly expanded the dimensions, while to a great extent retaining the style of the buildings they found in France. They seem also to have borrowed some of their ideas from the Rhine. See **GOTHIC ARCHITECTURE**.

The leading characteristics of their style were size and massiveness. They adopted the old Latin plan (derived from the Basilica) of central and side aisles; and at the east end, they invariably placed a semicircular apse. They seized on the tower as a distinguishing feature, and developed it as their style progressed. The ornaments are simple and of great variety; but the most common and distinctive are the zigzag, billet, chevron, nail-head, &c. The windows and doors are simple, with semicircular arched heads—the former without tracery. The tympanum of the door-arch is occasionally filled with sculpture.

The nave arches are carried sometimes on single pillars, but more frequently, especially as the style advanced, on piers with shafts. The shafts are almost always recessed in nooks (or 'nook shafts'). Owing to the great size of the buildings, the architects were unable at first to vault the main aisle, which, accordingly, had usually a wooden roof, the side aisles only being vaulted.

The masonry is rude; the joints being large, and the stones generally unhewn. The style prevailed from about the beginning of the 10th c. till the death of William the Conqueror, near the end of the 11th century. There are many examples in Normandy, the churches at Caen being well-known buildings of the date of William.

This style of architecture was brought into England by the Normans at the Conquest, 1066. They there extended the scale of the buildings, as they had done in Normandy, preserving, however, many local peculiarities of the Saxon style, which they found in the country. The chapel in the White Tower of the Tower of London is the earliest example of pure Norman work in England. There are, however, many buildings, both in England and Scotland, which date from before the end of the 12th c., when the pointed style began to be used. Durham, Lindisfarne, Canterbury, Dunfermline are partially Norman, besides many other churches and castles. The Anglo-Norman is heavier than the French-Norman, the cylindrical nave piers of the above buildings being much more massive than those of French works. To relieve this heaviness, the chevron, spiral, and other groovings were cut in the piers. The mouldings and forms of doors, windows, &c., are the same as those of Normandy. There is one remarkable difference in the plans of the Early Norman churches in the two countries: in France, the apse at the east end is always semicircular; in England, this form was gradually given up; and

towards the end of the style, the square east end was universally adopted.

**NORMANDY** (Fr. *Normandie*), formerly a province in the north of France, bordering on the English Channel; now divided into the departments of Seine-Inférieure, Eure, Orne, Calvados, and Manche. It is in general a very fertile, richly-cultivated land, resembling a garden in many districts. Its chief agricultural products are corn, flax, and fruits (from which cider is largely made); its fisheries and manufactures of great importance, and its horses the best in the kingdom. The inhabitants are for the most part descendants of the old Normans, and bear the stamp of their splendid ancestors. They are intelligent, strongly built, and of a noble and energetic character; warm-hearted and patriotic, they produce the boldest sailors, the most skilful fishermen, agriculturists, cattle-rearers, and gardeners in all France. In the north-eastern and more level part (formerly *Upper Normandy*), the principal towns are Rouen, Dieppe, Havre-de-Grace, Harfleur, Honfleur, Lisieux, Evreux, Yvetot; in the south-western and hilly part (*Lower Normandy*), the principal towns are Caen, Falaise, St-Lô, Bayeux, Coutances, Avranches, Balonne, Alençon, Cherbourg, and Mont-St-Michel.

In the time of the Romans, the country bore the name of *Gallia Lugdunensis II.* Under the Frankish monarchs it formed a part of Neustria, and was first called N. after Charles the Simple, in 912, had given it to Rolf or Rollo, the leader of a band of Norse rovers (see **NORMANS**), to be held by him and his posterity as a fief of the French crown. From Rolf (baptized into Christianity under the name of Robert) and Gisela, the daughter of Charles, sprung the later Dukes of N., of whom Richard I., grandson of Rolf, vigorously maintained his authority against his liege lords, Louis IV. and Lothaire. William II., son of Robert II., became Duke of N. in 1036; and in 1066, established a Norman dynasty on the throne of England (see **WILLIAM THE CONQUEROR**), thereby politically uniting N. with the latter country. In 1077, his eldest son, Robert, wrested N. from him, but it was again united to England under Henry I. in 1105. With this monarch, Rolf's male line became extinct. Henry II., the son of Henry I.'s daughter, Matilda, after the death of Stephen of Blois, obtained in 1154 the government of England and N.; but in the reign of his son, John Lackland, it was conquered by Philippe Auguste (1203—1204). It remained a portion of the French monarchy for more than 200 years; but after the battle of Agincourt (1415) it was reconquered by the English, who held it till 1449, when it was finally wrested from them by Charles VII. See Liquet's *Histoire de la Normandie* (2 vols. Paris, 1835).

**NORMANDY, CUSTOMARY LAW OF** (Fr. *Coutumier de Normandie*). The ancient provinces of France were governed principally by a system of laws called *Coutumes*, which had originated in local usages, and been in the course of time reduced to writing and formally sanctioned by the sovereign. *Coutume* was distinguished both from *loi*, which originated with the king, and from *us*, or usage not reduced to writing. Of the codes of customary law, one of the oldest and most famous was the *Coutumier de Normandie*. It was divided into the ancient and modern custom. The former was first reduced to a written form, in 1229, under St Louis; the latter was the ancient *coutumier*, modified and reformed in 1585 by commissioners appointed by Henry III., with the concurrence of the three estates of the nobility, clergy, and people of Normandy. The ancient *coutumier* treats principally

of the duties of the judicial officers, the proceedings in the different courts, and the rights and obligations of the kings of France, the Dukes of Normandy, the feudal lords, and the people. In modern *coutumier* are minute regulations regarding the transmission of property by will and inheritance. Each of the twenty-two vicomtés, into which N. was divided, had a different mode of devising real property. The law by which the Channel Islands are still governed is based on the customary law of Normandy. The chief judge in Jersey, Guernsey, and Alderney retains the Norman name of bailli or bailiff, and his authority is much the same as that of an officer possessed under the Norman law. One of the most remarkable remnants of the *coutumier* still subsisting in the Channel Islands is the *Clameur de Haro*. Any one who considers his rights of property are infringed, protests in the presence of two witnesses, and calling out the times 'Haro' (said to be a way of invoking Du Rollo, noted for his justice), summons the trespasser to desist. He then applies to the authorities relating what he has done, and proceeds to the Record Office, where note is taken of the circumstances; all which ceremonial must be gone through before bringing an action of trespass. The decision is generally referred to *une vue de justice*, and the losing party is subjected to a fine, and liable to costs: he had formerly also to undergo *un regu de château*, or twenty-four hours' imprisonment, having implored the aid of the prince without success.

**NORMANS** (i. e., Northmen), a name generally limited in its application to those sea rovers who established themselves in that part of France called after them, Normandy; but sometimes embraced also the early inhabitants of Norway. During the middle ages, the name Northmen, or Norsemen, was often used in a broader sense, to denote the entire population of Scandinavia, and still more frequently, perhaps, to designate the Danes and Norwegians exclusive of the Swedes. The Germans and Franks called the piratical hordes who ravaged their shores Normans or Northmen; the Saxons, usually Danes or Eastmen. They were also distinguished by the latter as *Mark-* or *March-men* (from *Den-mark*), *Ask-men* (i. e., men of the *ashen-ships*), and as *Heathen*. The primary cause of the plundering expeditions southward and westward across the seas, undertaken by the Norse Vikings (*Vikings* meaning either 'warriors,' or more probably dwellers on the *vics*, i. e., bays or fiords), as they called the selves, under leaders who took the name of 'Sea Kings,' was doubtless the over-population and consequent scarcity of food in their native homes; besides the relish for a life of warlike adventure, conjoined with the hope of rich booty, strongly attracted them while—at least as long as the old Scandinavian religion lasted (i. e., till about the end of the 10th c.)—death in battle was not a thing to be dreaded, if the slain hero passed into a region of eternal strife in the Walhalla of Odin. Finally, discontent with the ever-increasing power of the greater chieftains or kings, induced many of the nobles with their followers to seek new homes.

The first Danish Norsemen made their appearance on the eastern and southern coasts of England, 787. After 832, their invasions were repeated almost every year. To one of these belongs the legend of Ragnar Lodbrok (i. e., Ragnar of the 'Shaggy Brogues'), who is said to have been taken prisoner by Ella, king of Northumbria, and thrown into a dungeon filled with vipers, where, while expiring amid horrible torments, he sang with heroic exultation the story of his life. The very existence, however, of such a person as Ragnar Lodbrok is questioned by many Scandinavians.

## NORMANS.

scholars. In 851, the Norsemen wintered for the first time in the island, and after 866 obtained firm footing there. The Anglo-Saxon Ethelred I. fell in battle against them in 871. His brother Alfred, known as Alfred the Great (q. v.), after a long and doubtful struggle, partially reduced them to subjection; nevertheless, he was compelled to leave them in possession of Northumbria and East Anglia; and had not only to defend himself against a new and fierce invasion led by the famous rover Hastings (q. v.), but like his immediate successors, to contend against the revolts of his Dano-Norman subjects. A period of external peace now ensued; but in 991 the invasions of the Danes and Norwegians began anew. The Saxon king, Ethelred II., at first sought to buy them off by paying a sort of tribute-money, called *Danegelt* (q. v.); but the massacre of the Danes living in England, by command of that monarch, 13th November 1002, was avenged by four expeditions under the Danish king, Swen, who frightfully wasted the country, and finally conquered it in 1013, dying the following year. His son Knut, or Canute (q. v.), after carrying on a struggle for the supreme power with Ethelred and his successor Edmund Ironside (q. v.), at length, on the death of the latter, became sole monarch of England, which now remained under Danish or Norse rulers till 1042. The government of the country then reverted into the Saxon hands of Edward the Confessor (q. v.), who was succeeded in 1066 by Harold II. (q. v.), son of the powerful Godwin, Earl of Wessex (q. v.); but in October of the same year, Harold lost his life and crown at the battle of Hastings, and William the Conqueror, a descendant of a Norwegian chief who had settled in Normandy, once more established a Norse dynasty on the throne of England, but one greatly refined and improved by long residence in a comparatively civilised region.

It was also Danish Norsemen, in particular, who ravaged the western coasts of the European mainland, from the Elbe to the Garonne. As early as 810, the Danish king, Gottfried, had overrun Friesland; but the power of the great Charlemagne was too much for these undisciplined barbarians, and they were overawed and subdued for a time. Soon after his death, however, they recommenced (circa 820) their piratical expeditions, and favoured by the weaknesses and dissensions of the Carolingian rulers, became, during the 9th c., the terror and scourge of North-western Germany and France. They plundered Hamburg several times, ravaged the coasts of the Frisians (which then extended as far as the Scheldt), and in 843 firmly planted themselves at the mouth of the Loire. But ere long they ceased to be satisfied with making descents and settlements on the coasts, and in their small piratical craft they swarmed up the great rivers into the interior of the country, which they devastated far and wide. Thus, in 845, they ascended the Seine and plundered Paris—an exploit which was frequently repeated. In 885, not less than 40,000 of these Vikings are said to have ascended the river from Rouen under the leadership of one Siegfried in 700 vessels, and besieged the capital for ten months. It was only saved at the expense of Burgundy, which was abandoned to their ravages. In 881, Louis or Ludwig III., king of the West Franks, inflicted a severe defeat on the invaders at Vimeu, near Abbeville in Picardy, the memory of which has been preserved in a song still popular among the country-people; but neither that, nor the repulse which they sustained from the brave German monarch Arnulf, near Louvain in 891, could hinder them from making fresh irruptions. In 892, they appeared before Bonn, and tradition says that bands of Danish rovers penetrated even into Swit-

zerland, and established themselves in the canton of Schweiz and the vale of Hasli. From their settlements in Aquitania they proceeded at an early period to Spain, plundered the coasts of Galicia in 844, and subsequently landed in Andalusia, but were defeated near Seville by the Moorish prince Abd-ur-Rahman. During 859—860, they forced their way into the Mediterranean, wasted the shores of Spain, Africa, and the Balearic Isles, penetrated up the Rhone as far as Valence; then turning their piratical prow in the direction of Italy, entered the Tyrrhene Sea, burned Pisa and Lucca, and actually touched the distant isles of Greece before their passion for destruction was satiated, or before they dreamed of returning west.

Doubtless Norwegian rovers also took part in these so-called Danish expeditions. We know that as early as the beginning of the 9th c. they made voyages to the north of Ireland, Scotland, the Hebrides, the Orkney and Shetland Isles; and the increasing power of Harald Haarfager in the 9th and 10th centuries, exciting great discontent among the smaller chiefs, great emigrations took place, and these islands became the new homes of these Norwegian Vikings. About the same period, colonies were settled in the Farø Isles and Iceland, from which some Vikings proceeded westwards across the North Atlantic to Greenland in 982, and thence, in 1002, south to a region which they called *Vinland*, now universally believed to be the coast of New England, thus anticipating the discovery of America by Columbus by nearly 500 years. From Norway also issued the last and most important expedition against the coast of France. It was led by Rolf or Rollo, who had been banished by Harald Haarfager on account of his piracies. Rolf forced Charles the Simple to grant him possession of all the land in the valley of the Seine, from the Epte and Eure to the sea. By the time of Charles the Bald the invaders had firmly planted themselves in the country, which then went by the name of Normandy (q. v.). They and their descendants are, strictly speaking, the Normans of history—warlike, vigorous, and a most brilliant race. They rapidly adopted the more civilised form of life that prevailed in the Frankish kingdom—its religion, language, and manners, but inspired everything they borrowed with their own splendid vitality. At a later period (the 12th c.), they even developed a great school of narrative poetry, whose cultivators, the *Trouvours*, or *Trouvères*, rivalled in celebrity the lyrical Troubadours of Southern France. Their conquest of England, in 1066, gave that country an energetic race of kings and nobles, on the whole well fit to rule a brave, sturdy, but somewhat torpid people like the Anglo-Saxons. But though the Normans had acquired comparatively settled habits in France, the old passion for adventure was still strong in their blood; and in the course of the 11th c., many nobles with their followers betook themselves to Southern Italy, where the strifes of the native princes, Greeks and Arabs, opened up a fine prospect for ambitious designs. In 1059, Robert Guiscard, one of the ten sons of the Norman count, Tancred de Hauteville, all of whom had gone thither, was recognised by Pope Nicholas II. as Duke of Apulia and Calabria, and in 1071 as lord of all Lower Italy. His brother and liegeman, Roger, conquered Sicily, 1060—1089. Roger II. of Sicily united the two dominions in 1127; but in the person of his grandson, William II., the Norman dynasty became extinct, and the kingdom passed into the hands of the Hohenstaufen family.

The Swedish Norsemen directed their expeditions chiefly against the eastern coasts of the Baltic—Courland, Esthonia, and Finland, where they made their appearance in the 9th c.—the very time when

# NORTH-EAST AND NORTH-WEST PASSAGES.

maritime nations of Europe, and prompted them to send out expeditions to the East Indies for the purpose of obtaining a share in the lucrative traffic of which Spain had hitherto possessed the monopoly. But the latter power, then at the height of her prosperity, was not disposed to admit other nations as sharers of her good-fortune, and dealt so summarily with all intruders, having at that time the complete command of the Atlantic and Indian Oceans, that her rivals were reluctantly compelled to abandon all thoughts of trading in those seas. Unwilling, however, to lay aside their designs of opening a trade with the far-famed India and Cathay (as China was then called), they resolved to attempt to reach those regions by some other route. Two plans appeared most feasible—the one to reach Eastern Asia by coasting along the north of Europe and Asia, the *North-East Passage*; the other by sailing westward across the Atlantic. The latter was first attempted by John Cabot in 1497, but he found his progress barred by the American continent, or, at least, those parts of it known as Newfoundland and Labrador. Three years afterwards, Gaspard Cortereal and his brother made three several voyages in the same direction; and on reaching Newfoundland, sailed northwards, but were stopped on the coast of Labrador, in lat. 60° N. Both brothers afterwards perished, with all their followers. Several voyages were soon after made to discover if a passage for ships existed to the north of America (the *North-West Passage*), but without success; and the hardships which navigators were subjected to in these inhospitable climes, caused the abandonment for the time of all further investigations in that direction.

*North-East Passage.*—The search for a North-East Passage was now vigorously prosecuted, and England had the honour of sending out the first expedition for this purpose in 1553. It consisted of three ships, commanded by Sir Hugh Willoughby, and was fitted out under the direction of the celebrated Sebastian Cabot; but on rounding the North Cape, one of the ships was separated from the others during a violent storm, and subsequently entered the White Sea, then unknown to western Europeans. The other two, under Willoughby, drifted hither and thither in the vast waste of water surrounding the pole, till the navigators sighted Nova Zembla. Being unable to land, they sailed back along the north of Russia, and took up their winter quarters on the coast of Russian Lapland, where they were subsequently found frozen to death. Several other expeditions were, at different times, sent out by the English and Dutch, but none of them ever succeeded in penetrating further than the east coast of Nova Zembla, though they rendered good service to geography by making accurate surveys of Northern Europe and the adjacent islands of Spitzbergen, Nova Zembla, Waygat, &c. It was for a long time believed that the promontory which forms the eastern boundary of the Gulf of Obi was the *Tabis* of Pliny, and formed the north-east corner of Asia; and this opinion, which received the assent of the celebrated Gerard Mercator, tended greatly to encourage renewed explorations, as, according to it, the eastern coast of Asia was not more than 400 miles from Nova Zembla. The following is a list of the chief expeditions for the discovery of the North-East Passage:

Willoughby and Chancellor,	English,	1553
Burroughs,	"	1556
Pet and Jackman,	"	1580
Barentz, William (three expeditions),	Dutch,	1594–1596
Hudson, Henry, {first expedition,	English,	1608
{second expedition,	Dutch,	1609
Wood,	"	1670

In his third expedition Barentz nearly reached Icy Cape, about long. 100° E., but was, with his crew, imprisoned by the ice, and died before the return of spring. Various important discoveries were made during this expedition, which proved that in favourable seasons a passage could be found to the eastward, but after the subsequent failures of Hudson and Wood, the attempt was abandoned in despair. The Russian government now took up the search, and both by overland expeditions, and by vessels starting from various points on the north and east coasts of Siberia, sought to discover a practicable passage. The chief of these expeditions were those of Behring in 1741, which started from Petropaulovski, and was stopped at the East Cape; of Shalafroff, who with his crew perished of starvation; and of Billings, which started from the mouth of the river Kolyma, in Siberia. A final attempt was made by the Russian government by means of sledge expeditions in 1820–1823, which resulted in establishing the impracticability of any passage through these seas, on account of the constant alternation of open sea with fields of ice.

*North-West Passage.*—As was formerly mentioned, Sebastian Cabot and the brothers Cortereal were the first who attempted to double the north coast of America; Cabot had reached as far north as lat. 67° 30', in the strait between Greenland and America, but the courage of his crew failing, he was compelled to return. Notwithstanding his urgent representations, he was unable to prevail upon the English monarch to send out another expedition, and it was not till after several unsuccessful attempts had been made to find a North-East Passage that investigations of the north coast of America were resumed. As these investigations were carried on till within the last few years solely by the English, their prosecution till a definite result was arrived at came to be looked upon as a point of national honour, and repeated expeditions were sent out long after it had been clearly shewn that a North-West Passage, when found, would be useless in a mercantile point of view. In all, more than 200 voyages were made in search of the North-West Passage, so that only the most important of them can be even mentioned. The first expedition, after that of Cabot, was sent out in 1576, under James Frobisher, who made a second and third voyage in the two following years, but without any important discovery. In 1585–1588, northern enterprise received an impetus from the successful expeditions of Captain John Davis. This navigator sailed up the strait which bears his name, as far as lat. 72° north, and reported open sea still further north; he then surveyed the east and west sides of the strait, but without further important results. Henry Hudson (q. v.), who had previously attempted the North-East Passage, followed in 1610, and discovered the Hudson Strait and Bay, believing the latter to be none other than an inlet of the Pacific Ocean, an opinion which was proved erroneous by the investigations of Button in 1612; the latter, however, disseminated on his return the equally erroneous opinion that the bay was closed in on all sides, with the exception of the two eastern entrances. Button's account was not universally credited, and accordingly in 1615, Captain Bylot, who had been one of Hudson's company, was sent out, accompanied by Baffin, the most skilful navigator and scientific observer of the time; but their first expedition, which was to Hudson's Bay, was devoid of results. In their next voyage (1616), they sailed up Davis' Strait, reaching lat. 78° N., and satisfying themselves by a very superficial investigation that there was no northern outlet, the bay (as it was then believed to be) was named in honour of its explorer Baffin's Bay. On their

# NORTH-EAST AND NORTH-WEST PASSAGES—NORTH SEA.

return southwards, they coasted along the west side, and discovered an opening to the west which they named Lancaster Sound, but believing it to be only an inlet, did not explore further. On his return, Baffin gave it as his decided opinion that no outlet to the west existed from Baffin's Bay, and the attention of explorers was again directed to discover an outlet from Hudson's Bay. In 1619, the solitary attempt by foreign powers to aid in the search was undertaken by Jens Munk, a Dane, but he made no discoveries, and the attempt was not renewed. The expedition of Fox and James, in 1631, led to the partial exploration of the channel since known as the Fox Channel, which forms the northern outlet to Hudson's Bay, and from this time the spirit of discovery slumbered till 1741. Between this date and 1746, several expeditions were sent out to discover an outlet from the north-west corner of Hudson's Bay, but their united researches satisfactorily proved that no such outlet existed. Owing to these disappointments, the search for a North-West Passage was discontinued for more than half a century, notwithstanding the fact of the British parliament having promised a reward of £20,000 to the fortunate discoverer. In 1818, the Admiralty took up the search, and sent out Captain John Ross and Lieutenant Parry, who sailed up Davis' Strait, and ascended Lancaster Sound for thirty miles; here Captain Ross gave up the search, considering it to be hopeless. But this opinion was by no means coincided in by Parry, who was accordingly sent out in the following year, and succeeded in far outstripping all his predecessors in the career of northern discovery. He entered Lancaster Sound on 30th July, and a few days afterwards discovered a large inlet, thirty miles broad, which he named Prince Regent Inlet. After exploring this inlet for some distance, he returned, and continued his course westward, as the ice allowed him, passing through a strait which he named after Sir John Barrow, the promoter of the expedition. Continuing his westward course, he reached long. 110° W., in Melville Sound, where he was stopped by the ice; and after wintering here, and giving names to the numerous islands, seas, and straits he had discovered, returned to Britain, with the glory of having advanced 30° of longitude further west than any previous explorer. On his arrival, he was welcomed with the utmost enthusiasm, and his discoveries imparted renewed energy to the half-dormant maritime enterprise of the British. There was now no doubt in what direction the North-West Passage was to be sought, but Parry's second expedition (1821—1823) was for the purpose of determining whether the Fox Channel was connected with the Arctic Sea of his previous voyage; it was, however, unsuccessful. A little before this time, the coast-line of North America from Behring's Strait to Point Turnagain, in long. 109° W., had been fully traced, so that it only remained to find some navigable passage from Regent Inlet to this point, and the long-wished-for result would be attained. For this purpose, Captain John Ross was sent out with an expedition in 1829, and after a laborious and difficult voyage up Prince Regent Inlet, reached a point only 200 miles from Point Turnagain. It was during this voyage that he discovered the magnetic pole. Dease and Simpson, in 1838, extended the survey of the American coast from Point Turnagain to within 90 miles of the magnetic pole, but the hopes of a channel between these points were dashed by the discovery made by Dr John Rae, in 1847, that Boothia (the land which bounds Regent Inlet on the west) is a peninsula of the American continent. We now come to the unfortunate expedition of Sir John Franklin, which, it was fondly hoped, would settle the question of a

North-West Passage. It sailed from England 19, 1845, and was last seen in Baffin's Bay. Franklin is believed to have sailed through Lancaster Sound, and ascended Wellington Channel to the N., and thence returned southwards, to Barrow Strait, and sailing down the channel called Franklin Channel, which separates Somerset and Boothia Felix from Prince of Wales Island to the west, where, in lat. 70° N. 98° 30' W., his ships were beset with ice in September 1846, and Franklin died 11th June. The survivors abandoned the vessels 20 miles west of this point, and perished in the attempt to reach the American mainland. Many expeditions were sent out to search for the missing vessels, and one of these expeditions, under Captain McClure and M'Clure, sailed from Plymouth, 29th June 1850, and reached Behring's Strait in the same year. Sailing eastward the following spring, M'Clure's ship became fixed in ice about 60 miles west of Barrow Strait, and the crew were picked up by Sir Edward Belcher, who had been sent out in April 1852 to their assistance. Belcher, who had reached Melville Sound, and returned by the eastern passage through Lancaster Sound to Barrow Strait, returned the same way; and M'Clure and his company enjoyed the privilege of being the only ship's crew who had ever traversed from Behring's Strait to Baffin's Bay. M'Clure, then, belongs the honour of having set at rest all doubts as to the existence of a North-West Passage. By the various English and American expeditions which were sent out to explore the whole region to the north of the American mainland as far as lat. 77° N. long. 106° W., has been thoroughly explored, and the various channels of communication between the British Islands and the American continent, and Behring's Straits have been discovered, and the route by Hudson's Bay, Fox Channel, Foul Bay, Hecla Strait and Bellot Strait, into Franklin Channel, and thence by either the M'Clure or the Victoria Channel, or the routes by Lancaster Sound, and the M'Clintock Channel, Prince of Wales Inlet, or Prince of Wales Strait, to the north of Russian America, but all these routes are utterly useless in a mercantile point of view.

**NORTH SEA** (ancient *Germanicum Mare* or *Nord See*), that arm of the Atlantic Ocean which separates the British Islands on the west from the continent on the east. It is 700 miles in length (from north to south), about 400 in greatest breadth, and has an area of not less than 140,000 square miles. The great commercial ways from the N. S. to the Atlantic are the Pentland Firth and the Straits of Dover; while the east it communicates with the Baltic by Skagerrack, the Cattegat, Sound, and the Little Belts. Along its south-eastern and western coasts the shores are low, and are skirted by banks, formed by the sand deposits carried into the sea by the waters of the Elbe, Weser, Rhine, and Scheldt, which are the principal rivers that flow into this sea from the east. The shores of England, especially in the south, are also low, and have also accumulated, though not nearly to the extent as on the continental coasts. The British rivers that fall into the N. S. are the Thames, Ouse, Humber, Tyne, Tweed, Forth, and others. Besides the sand-banks on the coast, there are others extending into the middle of the sea-bed, similar in their position to those on the coasts, and occupying altogether three-fourths of the entire area. Of these the principal are the bank running north-east from the mouth of the Firth of Forth for 110 miles, and the one extending north-west from the mouth

## NORTH WALSHAM—NORTHUMBERLAND.

Elbe for about the same distance; the Dogger-bank (q. v.), &c. These sand-banks, combined with the storms and fogs so common in the N. S., render its navigation unusually dangerous. Another peculiarity of the bed of this sea is, the number of extraordinary 'holes' which have been found in it. Of these the most remarkable are the Little Silver Pit off Holderness in Yorkshire, and the North-north-east Hole, 8 leagues further east. Little Silver Pit is 25 miles in length, and from half a mile to two miles in width. At its edges there is a depth of from 50 to 80 feet of water, but the 'hole' has a depth of 330 feet. In the north, along the Norwegian coasts, the shores are steep and rocky, and there is a depth of about 190 fathoms. The depth (31 fathoms on an average) increases from south to north. The currents of this ocean are extremely various, and demand the greatest caution on the part of the navigator. Owing to the prevalence of south-west winds, the currents shew a general tendency towards the north-east. On the south-western coast of Ireland, the great tidal wave of the Atlantic is broken into two portions, one of which, coursing up the Channel, passes through the Straits of Dover; while the other, sweeping north, passes round the north of Scotland, and then southward along the east coast of Britain, and meets the southern wave off the coast of Essex. The northern portion of the tidal wave spreads over the whole of the German Ocean, and though on its entrance into the N. S. it is only 12 feet in height, it rises in its progress southward, as the sea becomes narrower, in the same way as the *bore* (q. v.) is formed in a contracting estuary. In the estuary of the Humber it rises to the height of 20 feet. This sea yields immense quantities of fish, the most important kinds being cod, hake, ling, turbot, sole, mackerel, and herring, also lobsters. The fisheries employ many thousand people. On all available points of the coasts, light-houses have been erected, and there are numerous floating-light vessels moored to detached banks. The traffic on the N. S. is enormous. It is surrounded by countries whose inhabitants have from the earliest times been famous on the seas, and the enterprise and national bias that formerly covered the Scandinavian waters with conquering fleets, may now be traced in the vast commercial intercourse carried on on the North Sea.

**NORTH WALSHAM**, a small market-town of England, in the county of Norfolk, on an acclivity on the right bank of the Ant, 14 miles north-north-east of Norwich. Its market-cross, repaired after the great fire in 1600, by which the town was almost entirely burned down, dates from the reign of Edward III. Pop. (1871) 2842.

**NORTH-WEST PROVINCES**, a great political division of British India (see INDIA), between Kumaon and Nepal on the north-east, and Rajpootana on the south-west, consisting of the following six subordinate divisions: Delhi, Meerut, Rohilkund, Agra, Allahabad, and Benares. Each of these divisions comprises five districts, with the exception of Benares, which comprises six. They are treated separately. The area of the North-West Provinces is 83,690 square miles; and the pop. (1871) 30,086,898.

**NORTHALLERTON**, capital of the North Riding of Yorkshire, a market-town and parliamentary borough, 250 miles north-north-west of London, and 30 miles north-north-west of York by railway. It stands near the left bank of the Wike. It contains a large number of public schools and other institutions. Manufactures of linen and leather, brick-making, and malting are

carried on on a limited scale. Pop. (1871) of parliamentary borough, 4961, who send a member to the House of Commons. The battle of the 'Standard,' so called from a huge standard erected on a car by the English, was fought here, August 22, 1138, between the English under the Earls of Albemarle and Ferrers, and the Scotch under King David. The latter were defeated, and forced to retreat with great loss.

**NORTHAMPTON**, a village of Massachusetts, U. S., 1 mile west of the Connecticut River, 95 miles west of Boston, on the Connecticut River Railway. It is celebrated for its beautiful scenery, Mounts Tom and Holyoke rising from a picturesque valley. It contains many elegant residences, the county buildings, 3 banks, several academies, 9 churches, 1 cotton factory, 2 silk factories, 3 paper-mills. A bridge, 1080 feet long, connects it with Hadley. Pop. (1870) 10,160.

**NORTHAMPTON**, capital of the county of the same name, a market-town, and parliamentary and municipal borough, on a rising-ground on the left bank of the Nen, 67 miles north-west of London by railway. In the centre of the town is a spacious market-square. The principal edifices are the shire-hall, the new and handsome town-hall, the corn exchange, the numerous churches, several of which are unusually interesting, as St Peter's, a recently restored and beautiful specimen of enriched Norman, and St Sepulchre's, much improved in 1865, one of the very few round churches in the empire, and referred to the 12th century. The hospitals of St John and St Thomas were religious houses prior to the Reformation. Boot and shoe making, which affords employment to about 3000 persons, is the principal branch of trade carried on here. Leather is made, and hosiery and lace are manufactured. Iron and brass foundries are in operation, and brewing is carried on. Two markets are held here weekly, a general one on Wednesday, and one for cattle on Saturday. Pop. (1871) of parliamentary borough, 44,871, who return two members to parliament.

N., a very ancient town, was held by the Danes at the beginning of the 10th c., and was burned by them in 1010. After the Conquest, it was bestowed on Simon de St Liz. Its castle was besieged by the barons in 1215, during the civil wars of King John. It was the scene of a great battle fought (July 10, 1460) during the Wars of the Roses, between the rival houses, in which the Earls of March and Warwick defeated the Lancastrians.

**NORTHAMPTONSHIRE**, a central county of England, bounded on the W. by the counties of Warwick, Leicester, and Rutland, and on the S.-W. by Oxfordshire. Area, 629,912 acres; pop. (1871) 243,891. Its surface is marked by gently undulating hills, alternating with well-watered vales. The chief rivers are the Nen and the Welland, both of which flow north-east, and fall into the estuary of the Wash. The county is traversed by the London and North-Western, the Great Northern, the Eastern Counties, and other lines of railway, and communication by water is maintained by the Union, Grand Junction, and other canals, as well as by the rivers. The climate of the county is mild and healthy; the soil, a black mould in the fen districts in the north-east, and a brown loam on the uplands, is very productive. White and green crops are abundantly produced, and on the rich pastures cattle are extensively reared for the London market. Four members are returned to the House of Commons for the county.

**NORTHUMBERLAND**, the most northern county of England, is bounded on the E. by the

# NORTON—NORWAY.

North Sea, and on the N.-W. by the Scottish counties of Roxburgh and Berwick. Area, 1,290,312 statute acres; pop. (1871) 386,646. The surface of the county has a rugged, and especially in the west and south-west a naked and barren aspect. The Cheviots run along the western border of the county, and send out spurs toward the east, which, gradually declining, are separated by fertile valleys, that widen as they approach the coast. About one-third of the area of the county is occupied by moorland, and along the Cumberland border the broken and bleak-looking hills are valuable for their lead-mines. Allenheads, the centre of the lead mining district, is the highest inhabited spot in England, being 1400 feet above sea-level. The inclination of the surface toward the east is indicated by the direction of the rivers Alne, Coquet, and North Tyne, which with the Tyne and Till are the principal rivers of the county. The Tweed forms the boundary of the county on the north for about 5 miles, and the south boundary is formed in part by the Derwent and Tyne. The climate is cold, but is milder on the coast than amid the hills, which, however, produce sufficient herbage for the maintenance of large flocks of 'Cheviot' sheep. The principal agricultural tracts occur along the coast, and inland along the river valleys for several miles. In these districts, the soil, for the most part, is a strong fertile clayey loam, productive in wheat, barley, beans, and clover. Agriculture is pursued on the most improved methods, and cattle, chiefly short-horned, are extensively reared. The south-east portion of the county forms a part of the great Northumberland and Durham coal-field, which produces about 25,000,000 tons annually. There are upwards of 100 pits in operation in the county. N. is traversed by the Newcastle and Carlisle, North-Eastern and Border Counties Railways. The county returns four members to the House of Commons; the county town is Alnwick (q. v.).

**NORTON, ANDREWS, REV.**, American scholar and theologian, was born at Hingham, Massachusetts, December 31, 1786. Having graduated at Harvard College in 1804, he was appointed, in 1809, a tutor of Bowdoin College, and in 1811 mathematical tutor at Harvard, and in 1813 librarian of the university, and succeeded Dr Channing as lecturer on biblical criticism and interpretation. In 1819, he was appointed Dexter Professor of Sacred Literature, which office he retained until failing health compelled his retirement in 1830. Dr Norton was, after Dr Channing, the most distinguished exponent of Unitarian theology, a clear and perspicuous lecturer, an able and conservative critic, and a voluminous writer. Rejecting the doctrine of the Trinity, and protesting against Calvinism, he also opposed the school of Theodore Parker and the naturalistic theology. Besides his contributions to the *General Repository* and *Review*, the *North American Review*, *Christian Examiner*, he published (1833) *A Statement of Reasons for not believing in the Doctrine of the Trinity*; (1837) *The Genuineness of the Gospels*; (1839) *On the Latest Forms of Infidelity*; and left some poems and a translation of the gospels. He died at Newport, Rhode Island, September 18, 1853.

**NORTON, THE HON. CAROLINE ELIZABETH SARAH**, a poetess and novelist of some reputation, the daughter of Thomas, and the granddaughter of Richard Brinsley Sheridan, was born in 1808. Her father died while she was still a child, and her education, which embraced an unusually varied course of studies, was superintended by her mother. In 1827, she married the Hon. George Chappel Norton. In 1831, she first met Lord Melbourne,

then prime-minister, and the i succeeded having given rise to a rumours, Mr Norton brought an act Melbourne, which, however, result for the defendant. From her chi had practised the art of verse-ma cipal works are *The Sorrows of Ros Undying One* (1830); *The Child* (1845); *Stuart of Dunleath*, a novel *Laws for Women in the Nineteenth The Lady of Garaye* (1862); *Los novel* (1863); and *Old Sir Douglas*.

Her prose works, several of w wrongs incident to the position. written with considerable cleverne and her verse, though overstrained sentiment, has numerous admirers, some degree of that brilliancy for v duns have been so famous.

**NORWALK**, a township of Co on both sides of the mouth of Nor Long Island Sound, on the New Haven Railway, 45 miles north-east and 31 south-west of New Haven. tories of iron, machinery, hats, felt-two companies make 500,000 yards churches, &c. Pop. (1870) 12,119.

**NORWAY** (Norweg. *Norge*), the of the Scandinavian peninsula, which Sweden, forms one joint kingdom between 57° 58' and 71° 10' N. lat., 5° and 28° E. long. It is bounded Sweden and Russia, and on every o rounded by water, having the Skager the German Ocean to the W., and the the N. Its length is about 1100 miles, at width about 250 miles; but between 67° and 68°, it measures little more t in breadth. The following table shes and populations of the 20 amter inter divided, as given in the last census of 18

Amter.	Area in Sq. M.

\* Or about 120,079 Eng. sq. m.

The population was estimated to number on December 31, 1872.

The Scandinavian peninsula consists of less connected mountain masses, which southern and western parts of N., con continuous tract of rocky highlands, declivities dipping into the sea, and only there broken by narrow strips of arable of Trondhjem (63° N. lat.), the ridge nearly the entire breadth of Norway. E

## NORWAY.

portions of the range, known as the Kjölle Fjelle,\* occupy a space of about 25 miles in width, and form, as far north as 69°, the boundary-line between Sweden and Norway. South of 63° N. lat., the range of the Scandinavian mountains is known as the Norska, or Dovre Fjelle, although the latter name belongs properly only to the part immediately in contact with the Kjölle. The general elevation of the Norska Fjelle does not rise above the line of perpetual snow, whose average height in these latitudes is 5000 feet; but it ranges above that of the growth of trees, which may be stated to lie 1000 feet lower. Only two carriage-roads traverse the Norska Fjelle, the one connecting Christiania with Bergen, and the other with Trondhjem. The Justedal glacier, in Bergen amt, is the largest on the continent of Europe, and covers an area of 588 sq. miles. The whole of the west coast of N. is densely fringed with islands and insulated rocky masses, which, north of 68°, in the Lofoden (q. v.) group, assume larger dimensions, and form extensive insular districts. The more important are Hinds (357 sq. m., 8190 inhabitants), on the borders of Nordland and Tromsø; Langö (147 sq. miles, 5812 inhab.); Karmö (only 21 sq. m., although the pop. is 11,827); and Senjen (273 sq. m., with 3339 inhab.). To the south of the Anden group, near the little islands, Mosken and Værö, occurs that eddying whirl of counter-currents known to us as the Maelström; but with this and a few other similar exceptions, no serious obstacles impede navigation along the numerous channels of the coasts. The most important of the rivers are the Glommen (350 miles long, with a basin of 6657 sq. miles), the Drams-elv, of less than half the length and basin, Tanne, Pasvikel, Skiens, Laagen, and Vornen. These and numerous other streams are of more importance for floating down timber to the fjords than for navigation. The fjords or inlets form a characteristic feature of Norwegian scenery, and give a coast-line of upwards of 800 miles.

The most considerable of the lakes of N. is the Mjösen, near Christiania; but even this lake, which in some places is more than 1400 feet deep, is scarcely 60 miles long, and has an area of less than 200 sq. miles. Swamps and morasses, which occupy a large area, have of late years engaged the attention of the government, which is endeavouring to drain and utilise them for agricultural purposes, and with a view of converting them into fields of turf and peat for fuel.

*Climate, Soil, &c.*—The peculiar physical character of N. necessarily gives rise to great varieties of climate in different parts of the country. The influence of the sea and of the Gulf Stream, and the penetration into the interior of deep inlets, greatly modify the severity of the climate, more especially on the west coast. Thus, while the mean annual temperature is for Christiania, on the east coast, 41°, it is 46°·8 Fahr. for Bergen on the west coast, which is only 30' further north. On the coast generally, rain and fogs prevail; while in the regions near the North Cape, storms are almost incessant. In the interior, the air is clear and dry, and the winters are cold and the summers hot, while on the coasts the opposite conditions prevail. The longest day, which in the south is 18 hours, may be said to be nearly three months in the high latitudes of the northern districts, where the longest night lasts almost an equal length of time. The protracted winter of the northern regions follows almost suddenly on the disappearance of the sun, when the absence of solar light is compensated for by the frequent appearance of the aurora borealis,

which shines with sufficient intensity to allow of the prosecution of ordinary occupations.

It is estimated that  $\frac{1}{10}$ th of the area of N. lies within the region of perpetual snow, while elevations exceeding 2000 feet above the level of the sea are unfitted for human habitations, although for a portion of the brief summers, the herdsmen can occupy *sætre* or huts at elevations of 3000 feet and upwards. A large extent of the mountain districts yields no produce beyond scanty grasses, mosses, lichens, and a few hardy berry-yielding plants. Only birch and juniper grow north of 67°, which is the boundary of the pine. The Scotch Fir, *Pinus sylvestris* (Norwegian, *Furn*), and Spruce, *P. abies* (Norwegian, *Gran*), cover extensive tracts, and with birch, constitute the principal wealth of Norway. The hardier fruits, as strawberries, gooseberries, cherries, and raspberries, are abundant and excellent of their kind. Hemp, flax, rye, oats, and barley are grown as far north as 66°; but although agriculture has been more systematically pursued of late years, the crops are not always sufficient for home consumption, and hence it is found absolutely necessary annually to import considerable quantities of corn and potatoes. The frugal peasantry do not, however, rely wholly upon importation, but prepare a species of cake or bread from the bark of the pine when corn is scarce, and in plentiful years store away some of the produce of the harvest in the national corn-magazines, which are established in every part of N. by way of a provision for an unfavourable season. Agriculture is most successfully prosecuted in the amts of Jarlsberg and Laurvik, and in the south generally; while in the northern parts, in the upper valleys, the rearing of cattle constitutes an important branch of industry. The herds and flocks are driven from the distant farms to the pasture-lands in these high mountain valleys, known as Sæterdale, where they remain till the approach of cold weather obliges the herdsmen to return with their charges to the shelter of the farms. Although the cattle and horses are small, they are generally strong and capable of bearing much hard labour.

*Products, &c.*—Fish is caught in almost every stream and lake of the interior, as well as in the fjords of the coast, and in the bays and channels which encircle the numerous islands skirting the long sea-line of Norway. Salmon, herring, and cod are of the greatest importance, and together give occupation to upwards of 50,000 men, who pursue the herring and cod fishing in the spring, and again in the summer, while cod is also fished in the winter-time. The value of the fish, fresh and dried, exported from N. in 1870, was 7,981,000 sp. d.,\* although that year was unfavourable in regard to the returns of deep-water fish. The average annual value of the fish and oil produce is between 9 and 10 millions of sp. d. In 1869 there were 38,000 men employed in the herring fisheries, and the value of the fish for that year was 250,000 sp. d. In the same year 15 Norwegian ships were engaged in the Jan Mayen (70° N. lat.) seal fisheries, when 33,000 young and 29,000 old seals were taken, and the profits of the captures were 45,000 sp. d. Next to the fisheries, N. derives its greatest sources of wealth from the produce of its woods. In 1870 there were 850,000 tons weight of timber (both deals and unhewn trunks) exported, of the net value of 7,600,000 sp. d. Within the last few years the Norwegian forests have yielded a new product of industry, known as wood-paste, extensively employed in the manufacture of paper, for which it promises to serve as a cheap and efficient substitute for rags.

\* Fjelle is the plural of fjeld, a mountain-side.

\* The specie daler is worth about 4s. 6d.

## NORWAY.

number of farms in each parish, are nominated to the office of schoolmaster. These men proceed from house to house, being supplied with a school-room, and fed and entertained by each householder in succession for the number of days at which the farm is mulcted; and by the aid of these means, education is so universally diffused that it is rare to meet with Norwegians who cannot read and write. In 1869, there were 150 higher poor schools, 15 normal schools for the parish-school teachers, 96 higher private schools, 16 military, naval, and navigation schools, and 12 polytechnic institutions. The expenses incurred for education were, for the country districts, 365,000 sp. d., and for the towns, 111,367 sp. d. The university of Christiania (q. v.), which was founded in 1811, has 45 professors, and is attended by 1000 students, amongst whom are the sons of many of the peasant land-owners, who receive a university education without intending to follow the learned professions.

*Army, &c.*—The army of N. is composed of regular troops and militia, or Landevern. The former numbered, in 1871, 13,600 men, and the latter 10,700, which, with a reserve of 19,350 men, and the Landstorm, or special war-levies, give, in time of war, a force of nearly 60,000 men. There is, besides, a special arm, known as the Skielöberen, or Skaters, which consist of a company of light infantry, carrying muskets, and ice-poles eight feet long. The fleet numbered in that year 121 vessels, of which 16 were steamers, carrying 150 guns, and 103 gun-boats. The navy was manned by 2250 sailors, but the number of men liable by law to be called upon for naval service in the maritime districts of N. exceeds 50,000. Horten, in Christiania-Fjord, is the principal naval port. The only fortified spots are Fredericksteen at Frederickshald, Frederikstad, Akershuus, Bergenshuus, Munkholm, and Vardöhuus.

The population of N. is chiefly rural, only about 11 per cent. living in towns. Christiania, the principal city, has 66,600 inhabitants, while Bergen and Trondhjem have respectively only 30,000 and 21,000. The physical character and consequent climatic relations of N. leave a very small proportion (according to some writers, only about 2 per cent.) of the area capable of being cultivated. There are few villages, and the isolated farmsteads are often separated from one another by many miles. The cultivators of the land are in most instances also the proprietors, less than one-third of the whole number being tenants only. Allodial land, known as Udal or Odal, does not descend to the eldest son unconditionally, since all his relatives have a claim upon it, and if it should be sold, have the right of buying it back within the term of five years at the sale-price.

*Roads, Railways, &c.*—The public roads in N. are excellent; and travelling is rendered cheap and expeditious by the system established and regulated by law, in accordance with which carriages and horses are provided at fixed rates of payment for travellers passing through the rural districts of the country. This system, which is known as 'Skyds,' is completely under the control and direction of the authorities, by whom the number of the guest-houses and stations are regulated. The length of the railways in N. in 1872 was about 300 miles, and the number of passengers conveyed on all the lines, 633,000; the length of the telegraphic wires is 5565 miles.

*Race, Language, &c.*—With the exception of some 20,000 Lapps and Finns, living in the most remote northern regions, the inhabitants of N. are generally a pure Scandinavian race, akin to the North Germanic nations of Aryan descent. The genuine Norwegians are of middle height, with strong, well-knit, muscular frames, of fair skin,

with light flaxen or yellow hair, and blue eyes. In character, they may be said to be frank, yet cautious and reserved, honest, religious, and superstitious, more from an inveterate love of clinging to the forms, thoughts, and creed of their ancestors, than from fanaticism. Their love of country, and the irrepressible fondness for the sea, by the very anomaly which these apparently contradictory propensities exhibit, shew them to be the true descendants of the sea-roving Northmen of old. Of late years, emigration has continued steadily to increase at a rate which threatens to be a serious evil to so badly populated a country as N., but which is easily explained by the small portion of land capable of cultivation. The general diffusion of education, and the perfect equality and practical independence which they have known how to secure and retain for themselves, notwithstanding their nominal incorporation with the other Scandinavian kingdoms, give to the poorest Norwegians a sense of self-respect and self-reliance which distinguish them favourably from those of the same class in other countries. The peasants, more especially in the amts remote from towns, retain their ancient provincial costumes, which are, for the most part, highly picturesque, consisting, among the women, of ample woollen skirts and brightly-coloured knit bodices, fastened and adorned with silver or brass clasps and buckles. Music is much cultivated by all classes of the people, and the national songs and melodies which are the favourites, are for the most part of a melancholy character.

Danish is the language in ordinary use both in writing and speaking, although dialects nearer akin to the old Norse are spoken by the dalesmen and mountaineers of special districts. Since the separation of the country from Denmark, a strongly national tendency has been manifested by some of the best Norwegian writers, and attempts have been made to reorganise these dialects into one general Norwegian language, and thus, in fact, to revive the ancient Norse, or Icelandic, which has been preserved in Iceland in almost perfect purity since its first introduction to the island in the 9th c. by colonists from the Scandinavian mother-lands. Among the most zealous cultivators of the ancient and modern literature and history of N., we may instance Professor P. A. Munch, whose able expositions of the laws and social conditions of his country have thrown new light on its history; Keyser, Unger, and Hohnboe, who have done much to elucidate the Norse tongue and literature; A. Munch, Bjerregaard, Hansen, and Welhaven the critic, successful cultivators of the national lyric; J. Moe and Asbjørnsen, collectors and annotators of native sagas; Ibsen the dramatist, and Bjørnsen the delineator of national peasant life. In the more abstruse departments of mathematical and physical science, Norwegians have gained for themselves a foremost place, as is sufficiently testified by the mention of names such as N. H. Abel, renowned for his discoveries in definite integrals; C. Hansteen, the astronomer; and Keilhau, the geologist.

*History.*—The early history of N. is comprised in that of the other Scandinavian countries, and is, like theirs, for the most part fabulous. It is only towards the close of the 10th c., when Christianity was introduced under the rule of Olaf I., that the mythical obscurity in which the annals of the kingdom had been previously plunged begins to give place to the light of historical truth.

The introduction of Christianity, which was the result of the intercourse which the Norwegians had with the more civilised parts of Europe through their maritime expeditions, destroyed much of the old nationality of the people with the heathenism

which they had hitherto cherished, although the sanguinary feuds which had raged among the rival chiefs of the land can scarcely be said to have lost their ferocity under the sway of a milder religion. Olaf II., or the Saint (1015—1030), who zealously prosecuted the conversion of his countrymen, raised himself to supreme power in the land by the subjection of the small kings or chieftains, who in the times of heathenism had subdivided the kingdom among them. The war between Olaf and King Knud the Great of Denmark, which terminated in 1030 with the battle of Sticklestad, in which the former was slain, brought N. under the sway of the Danish conqueror; but at his death in 1036, Olaf's son, Magnus I., recovered possession of the throne, and thenceforth, till 1319, N. continued to be governed by native kings. The death in that year of Hakon V. without male-heirs, threw the election of a new king into the hands of the national assembly, who, after many discussions, made choice of Magnus VIII. of Sweden, the son of Hakon's daughter. He was in turn succeeded by his son Hakon, and his grandson Olaf IV., who having been elected king of Denmark in 1376, became ruler of the sister Scandinavian kingdoms on the death of his father in 1380. This young king, who exercised only a nominal sway under the guidance of his mother Queen Margaret, the only child of Valdemar III. of Denmark, died without heirs in 1387. Margaret's love of power and capacity for government brought about her election to the triple throne of the Scandinavian lands, and from this period till 1814, N. continued united with Denmark; but while it shared in the general fortunes of the latter state, it retained its own constitutional mode of government, and exercised its right of electing to the throne, until, like the sister-kingdom, it agreed of its own free will to relinquish this privilege in favour of hereditary succession to the throne. See DENMARK, HISTORY OF. The Napoleonic crisis may be said to have severed this union, which had existed for more than 400 years, for Denmark, after having given unequivocal proofs of adhesion to the cause of Bonaparte, was compelled, after the disastrous war of 1813, to purchase peace at the cost of this long united partner of her state. Crippled in her resources, and almost a bankrupt, she saw herself constrained to sign the treaty of Kiel in 1814, by which it was stipulated by the allied powers that she should resign N. to Sweden, receiving in return, by way of indemnity, some portion of Swedish Pomerania and the island of Rügen, which were subsequently exchanged with Prussia for Lauenburg on the payment by that state of two million rix-dollars. The Norwegians, having refused to admit the validity of the treaty of Kiel, nominated Prince Christian, the heir-presumptive to the throne of Denmark, regent and subsequently king of Norway. This nomination was made by the national diet, or Storting, which met at Eidsvold, where they drew up a constitution based on the French constitution of 1791. These measures found, however, neither supporters nor sympathisers among the other nations; and with the sanction of the great allied powers, Charles John Bernadotte, Crown-Prince of Sweden, led an army into N., and after taking Frederickstad and Fredericks-hald, threatened Christiania. Denmark being unable to support the cause of Prince Christian, and N. being utterly destitute of the means necessary for prosecuting a war, resistance was of no avail, and the Norwegians in this untoward conjuncture of affairs, were glad to accept the proposals made to them by the Swedish king for a union with Sweden, on the understanding that they should retain the newly promulgated constitution, and enjoy full

liberty and independence within their own areas. These conditions were agreed to, and maintained; a few unimportant alterations in the constitution, necessitated by the altered state of the new union, being the only changes in the machinery of government. Charles was declared joint king of Sweden and N., and while the latter has become an independent state, it is questionable whether it has found in its nominal acquisition an atonement for the loss of Finland, which was the price for it by the allied powers, and made over to Sweden. Since the union, N. has firmly resisted every attempt on the part of the Swedish monarchs to upon the constitutional prerogatives of the king, and during the reign of the first of the Bernadotte dynasty, the relations between him and his Norwegian subjects were marked by jealousy and distrust on both sides; but, since his death, the relations have been more contented, and N. has continued to make rapid progress toward a state of political security and material prosperity greater than it ever enjoyed under the Danish dominion.—See T. Thorlak, *Historia reipublice Norvegicarum* (Copenh. 1711); Schöningh, *Neue Historie* (Soroe, 1771); Münch, *Det Norske Rigs Historie*, Bd. 1—6 (Christ. 1852—1859); *til Norges Officielle Statistik*, 1871.

## NORWAY HADDOCK. See BENNETT.

NORWICH, a city of England, capital of the county of Norfolk, and a county in itself, situated on the river Wensum, immediately above its confluence with the Great Ouse, 20 miles west of Yarmouth, and 100 north-north-east of London. It covers an area of about five miles in circumference, is skirted by the river to the north and east sides by the river, and on the south it was formerly surrounded by a ditch, the last vestiges of which have been recently removed in order to make room for the extension of the city. The market-place (600 feet long by 340 feet wide) and its vicinity contain many large shops and houses. The castle, finely situated on a hill near the centre of the town, originally built by the Normans, with its works, an area of about 23 acres, and a bridge (150 feet long) over the ditch has the largest and most perfect Anglo-Norman architecture remaining. The massive quadrangular tower is now used as a prison. The cathedral, almost a perfect Norman in plan, was founded in 1094 by Bishop Herbert Losinga. It is 411 feet long, 100 feet broad at the transepts, and is surmounted by a spire 315 feet high. Near the cathedral are a number of ancient and interesting structures now in ruins, among which may be mentioned the Ethelbert's and the Erpingham Gate, the Decorated English, the latter in late Perpendicular style, and both valuable and rich specimens of the architecture of the 15th c. Besides a large number of dissenting churches, other places of worship, there are about 40 of which St Peter's, Mancroft, a handsome Perpendicular edifice of the 15th c., with a remarkable peal of 12 bells; St Andrew's, St Clement's, St George's, St Giles, St Michael's, and others worthy of mention. The Free Grammar School, with an endowment of about £200 a year, founded by Edward VI., and the other educational establishments are numerous and various. The public library contains 20,000 volumes, and the library of the Norwich Literary Institution 15,000 volumes. N. is the seat of extensive flourishing manufactures, the chief of which are bandanas, bombazines, shawls, crapes, damasks, camlets, and muslins; shoes are extensively carried on; yarn and silk are spun, and many hands are employed in operation, and employ many hands. Iron

## NORWICH—NOSE, AND THE SENSE OF SMELL.

tanning, dyeing, malting, &c., and agricultural implement-making, are also carried on. The trade, which is facilitated by a canal and river system of communication with the sea, is chiefly in agricultural produce and coal. N. is the see of a bishop, and returns two members to parliament. Pop. of municipal and parliamentary borough in 1871, 80,386.

About three miles south of N. is Castor St Edmunds, which, prior to the Roman era, was called Caister, and under the Romans received the name of *Venta Icenorum*. N., which occupies a place in history from the time of the earlier Danish invasions, had its origin in the castle erected as a stronghold by the East Anglian kings, and resorted to as a place of safety by the inhabitants of *Venta Icenorum*, who gave it the name of North-wic, or northern station or town, on account of its relative position with respect to their own town. The bishopric of the East Angles was removed hither in 1094. About 4000 Flemings settled at N. in the reign of Elizabeth, and greatly increased the prosperity of the town by the branches of manufacture which they introduced.

**NORWICH**, a city of Connecticut, U. S., at the head of navigation of the Thames River, 13 miles north of New London, and 38 south-east of Hartford. The town consists of three large villages, one composed of beautiful and finely-situated residences; the others of nearly 100 manufactories of cotton, wool, paper, &c., which are supplied with water-power by falls of 50 feet on the Yantic River. N. contains county buildings, 7 banks, 1 daily and 2 weekly papers, 19 churches, 40 public and 5 private schools, and a free academy. N. was settled in 1659, when 9 square miles were bought for £70 of Uncas, an Indian chief, whose grave is in the village. Pop. in 1860, 14,047; in 1870, 16,653.

**NORWICH** or **MAMMALIFEROUS CRAG**, a series of highly fossiliferous beds of sand, loam, and gravel, of Pleistocene age, occurring at several places within a few miles of Norwich, where they are popularly named 'Crag.' They contain a mixture of marine and fresh-water mollusca, with ichthyolites and bones of mammalia. They are evidently estuary beds, the most common shells being the very species now abundant in such situations around the coasts of Britain; but with them are associated a few extinct species. The beds rest on the white chalk, the surface of which is frequently perforated by *Pholas crispata*, the shell still remaining at the bottom of the cavity. The mammalian bones belong to species of elephant, horse, pig, deer, and field-mouse. With them are occasionally found the bones of *Mastodon angustidens* and some mollusca, which belong to the Red Crag. Their occurrence here is believed to have arisen from their having been washed out of the Red into this, the Norwich Crag.

**NORWOOD**, **UPPER** and **LOWER**, are two villages in Surrey, England, with a station on the London and Croydon Railway, 6 miles south of London. The public pleasure-ground, called the Beulah Spa, is prettily laid out around a mineral spring. The villages are worthy of mention, however, chiefly on account of their schools, among which are a district school for the pauper children of Lambeth parish, and a very large and important educational establishment for the pauper children of London. The district parish of N. had, in 1871, a population of 12,536.

**NOSE, AND THE SENSE OF SMELL.** The nose is not only the organ of smell, but is likewise a part of the apparatus of respiration and voice. Considered anatomically, it may be divided into an

external part—the projecting portion, to which the term *nose* is popularly restricted; and an internal part, consisting of two chief cavities, or *nasal fossae*, separated from one another by a vertical septum, and subdivided by spongy or turbinated bones projecting from the outer wall into three passages or *meatuses*, with which various cells or *sinuses* in the ethmoid, sphenoid, frontal, and superior maxillary bones communicate by narrow apertures.

Fig. 1.—A Longitudinal Section of the Nasal Fossae of the Left Side, the Central Septum being removed:

1, the frontal bone; 2, the nasal bone; 3, part of the ethmoid bone; 4, the sphenoidal sinus. *a*, the superior turbinate bone; *b*, the superior meatus; *c*, the middle turbinate bone; *d*, the middle meatus; *e*, the inferior turbinate bone; *f*, the inferior meatus; *gg*, a probe passed into the nasal duct.

The external portion of this organ may be described as a triangular pyramid which projects from the centre of the face, immediately above the upper lip. Its summit or root is connected with the forehead by means of a narrow bridge, formed on either side by the nasal bone and the nasal process of the superior maxillary bone. Its lower part presents two horizontal elliptical openings, the *nostrils*, which overhang the mouth, and are separated from one another by a vertical septum. The margins of the nostrils are usually provided with a number of stiff hairs (*vibrissae*), which project across the openings, and serve to arrest the passage of foreign substances, such as dust, small insects, &c., which might otherwise be drawn up with the current of air intended for respiration. The skeleton, or framework of the nose, is partly composed of the bones forming the top and sides of the bridge and partly of cartilages, there being on either side an upper lateral and a lower lateral cartilage, to the latter of which are attached three or four small cartilaginous plates, termed *sesamoid cartilages*; there is also the cartilage of the septum which separates the nostrils, and in association posteriorly with the perpendicular plate of the ethmoid, and with the vomer, forms a complete partition between the right and left nasal fossae. It is the lower lateral, termed by some writers the *alar cartilage*, which by its flexibility and curved shape forms the dilatable chamber just within the nostril. The nasal cartilages are capable of being slightly moved, and the nostrils of being dilated or contracted by various small muscles, which it is unnecessary to describe. The integument of the nose is studded with the openings of sebaceous follicles, which are extremely large and abundant in this region. The oleaginous secretion of these follicles often becomes of a dark colour near the surface; and hence the spotted appearance which the tip and lower parts of the sides, or *ala*, of the nose frequently present. On firmly compressing or pinching the skin of these parts, the inspissated

secretion is forced out of the follicles in the form of minute white worms with black heads.

The *nasal fossae*, which constitute the internal part of the nose, are lofty, and of considerable depth. They open in front by the nostrils, and behind they terminate by a vertical slit on either side in the upper part of the pharynx, above the soft palate, and near the orifices of the eustachian tubes, which proceed to the tympanic cavity of the ear.

The mucous membrane lining the nose and its cavities is called *pituitary* (Lat. *pituita*, slime, rheum), from the nature of its secretion; or *Schneiderian*, from Schneider, the first anatomist who shewed that the secretion proceeded from the mucous membrane, and not, as was previously imagined, from the brain; it is continuous with the skin of the face at the nostrils, with the mucous covering of the eye through the lachrymal duct (see EYE), and with that of the pharynx and middle ear posteriorly. This membrane varies in its structure in different parts of the organ. On the septum and spongy bones bounding the direct passage from the nostrils to the throat, the lining membrane is comparatively thick, partly in consequence of a multitude of glands being disseminated beneath it, and opening upon it, but chiefly, perhaps, from the presence of ample and capacious submucous plexuses of both arteries and veins, of which the latter are by far the more large and tortuous. These plexuses, lying as they do in a region exposed more than any other to external cooling influences, appear to be designed to promote the warmth of the part, and to elevate the temperature of the air on its passage to the lungs. They also serve to explain the tendency to hemorrhage from the nose in cases of general or local plethora. In the vicinity of the nostrils, the mucous membrane exhibits papillae and a scaly epithelium, like the corresponding parts of the skin. In the sinuses, and in all the lower region of the nose, the epithelium is of extreme delicacy, being of the columnar variety, and clothed with cilia. In the upper third of the nose—which, as the proper seat of the sense of smell, may be termed the *olfactory region*—the epithelium ceases to be ciliated, assumes a more or less rich sienna-brown tint, and increases remarkably in thickness, so that it forms an opaque soft pulp upon the surface. It is composed of an aggregation of nucleated particles, of nearly uniform appearance throughout, except that the lowest ones are of a darker colour than the rest, from their containing a brown pigment in their interior. Dr Todd and Mr Bowman remark, in their *Physiological Anatomy*, from which we have condensed the above account of the nasal mucous membrane, that the olfactory region abounds in glands, apparently identical with sweat glands, which dip down in the recesses of the submucous tissue among the ramifications of the olfactory nerve.

The nerves of the nose are the first pair or olfactory which are specially connected with the sense of smell, branches of the fifth pair which confer ordinary sensibility on its skin and mucous membrane, and motor filaments, from the facial nerve to the nasal muscles. The olfactory nerve on each side is connected with the inferior surface of the Brain (q. v.) by an external, a middle, and an internal root, which unite and form a flat band (or, more correctly, a prism), which, on reaching the cribriform plate of the ethmoid bone, expands into an oblong mass of grayish-white substance, the *olfactory bulb*. From the lower surface of this bulb are given off the *olfactory filaments*, fifteen or twenty in number, which pass through the cribriform foramina, and are distributed to the mucous membrane of the olfactory

region. These filaments differ essentially from the ordinary cerebral nerves. They consist of a white substance of Schwann, are not divided

Fig. 2.—The Distribution of the Olfactory Nerve in the Septum of the Nose:

1, the frontal sinus; 2, the nasal bone; 3, the sphenoid bone; 4, the posterior opening of the left nostril; 5, the opening of the Eustachian tube; 6, a section of the palate; 7, a section of the hard palate; 8, the nerve; 9, its three roots; 10, its bulb, from which the nerve proceeds downwards through the cribriform plate of the ethmoid bone; a, the nerve; b, its three roots; c, its bulb, from which the nerve proceeds downwards through the cribriform plate of the ethmoid bone; d, the nasal branch from the ophthalmic division of the fifth nerve; e, the naso-palatine nerve from the maxillary ganglion; f, its branches; g, the septum of the nose.

elementary fibrillae, and resemble the gelatine in being nucleated, and of a finely granular texture. The branches of the fifth pair (or trifurcated to the nose are the nasal nerve (derived from the ophthalmic division), which supplies the mucous membrane in the vicinity of the nostrils, and the naso-palatine nerve (derived from the maxillary division), which is connected with the maxillary ganglion, which is connected with the maxillary division), which supplies the mucous membrane on the spongy bones and on the septum. The peculiar sensation that precedes sneezing, an affection of the nasal nerve, and the tears that accompanies a severe fit of sneezing, explained by the common source of this lachrymal nerve; while the common sense of the nose, generally, is due to the branches of the fifth pair and of the naso-palatine nerve.

The nature of odorous emanations is not known, that it is impossible to give an account of the mode in which they produce impressions. From the fact that most substances are volatile, and *vice versa*, it is presumed that they consist of particles of minuteness dissolved in the air; yet delicate experiments have failed to detect loss of weight in musk, and other strongly odorous substances, after they have been freely exposed to their effluvia for several years. But it may be the nature of the odorous matter that it should be transmitted by the respiratory current through the nostrils to the olfactory region, whose membrane must be in a healthy condition. If it is too dry, or if there is an inordinate excretion of fluid from its surface, of which conditions occur in catarrh of the head, smell is impaired or lost, in consequence of the necessary penetration of the odour to the nervous filaments being prevented. The acuteness of the sense of smell is in

in many of the lower animals (dogs, for example) than in man, and they employ it in guiding them to their food, in warning them of approaching danger, and for other purposes. To civilised man its utility is comparatively small; but it is occasionally much increased when other senses are deficient. In the well-known case of James Mitchell, who was deaf and blind from his birth, it was the principal means of distinguishing persons, and enabled him at once to perceive the approach of a stranger. Amongst many savage tribes the sense is almost as acute as in many of the lower mammals. For example, the Peruvian Indians are able, according to Humboldt, to distinguish, in the middle of the night, whether an approaching stranger is a European, American Indian, or Negro.

Although all poisonous gases are not odorous, and all bad odours may not be positively deleterious to health, there can be no doubt that one of the principal objects for which the sense of smell is given to us is to enable us to detect atmospheric impurities, many of which are of a most noxious character, and give rise to the most serious forms of fever.

NOSE-RING. See RING.

NOSING, the projecting edge of a moulding, such as the bead or bottle used on the edge of steps, to which the term is most frequently applied.

NOSOLOGICAL (Gr. *nōsōs*, disease) is that branch of the science of medicine which treats of the distribution and arrangement of diseases into classes, orders, &c. Many systems of nosology have at different times been adopted; some of which have been based upon the nature of the ascertained causes of diseases; others on the pathological states or conditions which attend diseases; others on the differences between structural and functional diseases, &c. It is hard to say which is the most perfect method; but that of Dr Farr, one of the most distinguished living medical statisticians, is adopted by the Registrar-General in the Reports on the mortality of London and England, and is becoming more generally adopted than any other. It has the advantage over the antiquated but once popular system of Cullen (1792) of meeting the requirements of modern science, and (by illustrating great questions connected with public health) of shewing those causes that are injurious or fatal to life, and of thus contributing to the removal of those evils (bad drainage, imperfect ventilation, &c.) which tend to shorten human existence.

We append Dr Farr's system of nosology, which is arranged in four primary classes, each of which includes various orders:

CLASS I. ZYMOTIC DISEASES (Gr. *zymē*, a ferment).—Diseases that are either epidemic, endemic, or contagious, and that are induced by some specific body, or by want of food or by its bad quality. In this class there are four orders—viz., Order I. *Miasmatic Diseases* (Gr. *miasma*, a stain), such as small-pox, measles, scarlet-fever, diphtheria, typhus and typhoid fevers, cholera, ague, &c. Order II. *Enthetic Diseases* (Gr. *enthētos*, put in or implanted), such as syphilis, gonorrhoea, glanders, hydrophobia, malignant pustule, &c. Order III. *Dietic Diseases* (Gr. *diēta*, way of life or diet), such as famine, fever, scurvy, purpura, rickets, bronchocoele, delirium tremens, &c. Order IV. *Parasitic Diseases*, such as scabies (or itch), and worm disorders from animal parasites, and ring-worm, scald-head, &c., from vegetable parasites or fungi.

CLASS II. CONSTITUTIONAL DISEASES.—Diseases affecting several organs, in which new morbid products are often deposited; sometimes hereditary.

This class contains two orders. Order I. *Diathetic Diseases* (Gr. *diathēsis*, condition or constitution), including gout, anæmia, cancer, melanosis, lupus, &c. Order II. *Tubercular Diseases*, such as scrofula, phthisis, mesenteric disease, tubercular meningitis, &c.

CLASS III. LOCAL DISEASES.—Diseases in which the functions of particular organs or systems are disturbed or obliterated with or without inflammation; sometimes hereditary. This class includes eight orders. Order I. *Brain Diseases* (or more correctly, *Diseases of the Nervous System*), such as apoplexy, paralysis, epilepsy, chorea, hysteria, mania, &c. Order II. *Heart Diseases* (or more correctly, *Diseases of the Circulatory System*), such as pericarditis, endocarditis, aneurism, angina pectoris, atheroma, phlebitis, varicose veins, &c. Order III. *Lung Diseases* (or more correctly, *Diseases of the Respiratory System*), such as bronchitis, pneumonia, pleurisy, asthma, empyema, laryngitis, &c. Order IV. *Bowel Diseases* (or more correctly, *Diseases of the Digestive System*), such as stomatitis, gastritis, enteritis, peritonitis, jaundice, &c. Order V. *Kidney Diseases*, such as Bright's disease, nephritis, ischuria, diabetes, stone, gravel, &c. Order VI. *Genetic Diseases* (or *Diseases of the Generative System*), such as hydrocele, ovarian dropsy, &c. Order VII. *Bone and Muscle Diseases*, such as caries, necrosis, exostosis, synovitis, muscular atrophy, &c. Order VIII. *Skin Diseases*, such as urticaria, eczema, herpes, impetigo, acne, lichen, prurigo, &c.

CLASS IV. DEVELOPMENTAL DISEASES.—Special diseases, the incidental result of the formative, reproductive, and nutritive processes. It contains four orders. Order I. *Developmental Diseases of Children*, such as malformations, idiocy, teething, &c. Order II. *Developmental Diseases of Women*, such as amenorrhœa, childbirth, change of life, &c. Order III. *Developmental Diseases of Old People*, such as old age, and its concomitant affections. Order IV. *Diseases of Nutrition*, such as atrophy, debility, &c.

NOSTOC, a genus of plants of the natural order *Algae*, suborder *Confervaceæ*, found upon moist ground, rocks near streams, &c., and consisting of a somewhat gelatinous hollow tumid frond, filled with simple filaments resembling strings of beads. *N. commune* is frequent in Britain, springing up suddenly on gravel-walks and pasture-grounds after rain. It is a trembling gelatinous mass, often called STAR JELLY, and vulgarly regarded, owing to the suddenness with which it makes its appearance, as having fallen from the skies, and as possessed of important medicinal virtues. *N. edule* is employed in China as an article of food.

NOSTRADAMUS, a celebrated astrologer of the 16th c., born 14th December 1503, at St Remi, in Provence. His proper name was Michel Notre-Dame, and he was of Jewish descent. He studied first at the Collège d'Avignon, where he exhibited remarkable scientific powers, and subsequently attended the celebrated school of medicine at Montpellier. Here he first acquired distinction during an epidemic that desolated the south of France, by his humane attentions to those stricken by the pestilence. After taking his degree, he acted for some time as professor, but was induced by his friend J. C. Scaliger to settle in Agen as a medical practitioner. After travelling for some time, he finally settled at Salon, a little town situated in the environs of Aix, about 1544. Already he must have been reckoned a man of note, for in the following year, when an epidemic was raging at Lyon, he was solemnly invited thither by the civic authorities, and is said to have rendered immense services. He first fell upon his prophetic vein about the year

35 members. For more than a century and a half even this poor acknowledgment of any other mind or will in the nation than that of the sovereign ceased to be made; but when the state of the finances brought the monarchy into difficulties and perils, Louis XVI., at the instigation of the minister Calonne, had recourse again to an Assembly of Notables, which met 22d February 1787, and was dissolved 25th May. It consisted of 137 members, among whom were 7 princes of the blood, 9 dukes and peers, 8 marshals, 11 archbishops, 22 nobles, 8 councillors of state, 4 masters of requests, 37 judges, 12 deputies of the Pays d'Etats, the civil lieutenant, and 25 persons belonging to the magistracy of different cities of the kingdom. Calonne's representations of the state of the finances induced the Notables to adopt many reforms in the matter of taxation; but no sooner was the assembly dissolved, than many of them joined the parliaments in opposition to resolutions adverse to their private interests, so that the king was compelled to determine upon assembling the States General. Necker, who had meanwhile been placed at the head of affairs, assembled the Notables again, 6th November 1788, to consult them concerning the form in which the States General should be convened, and particularly concerning the number of members of the third estate and the manner of voting. The Notables declared against every innovation, and so compelled the court to half measures, which helped to prepare the way for the Revolution.

**NOTARY-PUBLIC** is an officer of the law, whose chief function is to act as a witness of any solemn or formal act, and to give a certificate of the same; which certificate, if duly authenticated, is accepted all the world over as good evidence of the act done in his presence, and attested by him. The services of a N. are chiefly available where his evidence is to be used in a foreign country. Solicitors are sometimes notaries-public, but in England there are fewer notaries, comparatively, than in Scotland, where notarial acts and certificates are more largely used.

**NOTATION**, the method of representing numbers and quantities by marks or signs. The representation of numbers is known as 'arithmetical,' and that of quantities as 'symbolical' notation.

**I. ARITHMETICAL NOTATION.**—The invention of arithmetical notation must have been coeval with the earliest use of writing, whether hieroglyphic or otherwise, and must have come into use about the time when it was felt that a mound, pile of stones, or huge misshapen pillar, was insufficient as a record of great events, and required to be supplemented by some means which would suffice to hand down to posterity the requisite information. The most natural method undoubtedly was to signify 'unity' by one stroke, thus: |; 'two' by two strokes, ||; 'three' by three strokes, |||, &c.; and, as far as we know, this was the method adopted by most of those nations who invented systems of notation for themselves. It is shewn on the earliest Latin and Greek records, and is the basis of the Roman, Chinese, and other systems. We have thus a convenient division of the different notational systems into the *natural* and *artificial* groups, the latter including the systems of those nations who adopted distinct and separate symbols for at least each of the nine digits. The Roman and Chinese systems are the most important of the former, and the Hebrew, later Greek, and 'decimal' systems of the latter group.

**Roman System.**—The system adopted by the Romans was most probably borrowed at first from the Greeks, and was distinguished equally by its simplicity and its cumbrousness. The following

seems to be the most probable theory of its development. A simple series of strokes was the basis of the system; but the labour of writing and reading large numbers in this way would soon suggest methods of abbreviation. The first and most natural step was the division of the strokes into parcels of tens, thus, , a plan which produced great facility in the reading of numbers. The next step was to discard these parcels of ten strokes each, retaining only the two cross strokes, thus, X, as the symbol for 10. Continuing the same method as larger numbers came to be used, they invented a second new symbol for 100, thus, C (which was at first probably the cancelling stroke for ten X's in the same way as X was originally the cancelling stroke for ten units); and for the sake of facility in writing, subsequently employed the letter C, which resembled it, in its place. The circumstance that C was the initial letter of the word *centum*, 'a hundred,' was doubtless an additional reason for its substitution in place of the original symbol for 100. An extension of the same process produced M, the symbol for 1000, which was also written  $\Lambda$ ,  $\nabla$ , and very frequently CI $\rho$ . This symbol was probably suggested by the circumstance that M was the initial letter of the Latin word *mille*, signifying a thousand. The early Roman system went no higher. But though the invention of these three symbols had greatly facilitated the labour of writing down and reading off numbers, further improvements were urgently required. The plan of 'bisection of symbols' was now adopted; X was divided into two parts, and either half, V or  $\Lambda$ , used as the symbol for 5; C was similarly divided,  $\zeta$  or L standing for 50; and  $\mathcal{N}$ , CI, or I $\rho$ , was obtained in the same manner, and made the representative of 500. The resemblance of these three new symbols to the letters V, L, and D, caused the substitution of the latter as the numerical symbols for 5, 50, and 500. A final improvement was the substitution of IV for 4 (in place of IIII), IX for 9 (in place of VIIII), XC for 90 (instead of LXXXX), and similarly XL for 40, CD for 400, CM for 900, &c.; the smaller number, when in front, being always understood as subtractive from the larger one after it. This last improvement is the sole departure from the purely additive mode of expressing numbers; and if the symbols for 4, 9, 90, &c., be considered as single symbols, which they practically are, the deviation may be looked upon as merely one of form. In later times, the Roman notation was extended by a multiplication of the symbol for 1000, thus CCI $\rho\rho\rho$  represented 10,000; CCCI $\rho\rho\rho$  represented 100,000, &c.; and the bisection of these symbols gave them I $\rho\rho\rho$  and I $\rho\rho\rho\rho$  as representative of 5000 and 50,000 respectively. This, in all probability, is the mode according to which the Roman system of notation was constructed. To found a system of arithmetic upon this notation would have been well-nigh impossible; and so little inventive were the Romans, that the attempt seems never to have been made. They performed what few calculations they required by the aid of the *Abacus* (q. v.).

**Chinese System.**—This system presents a strong resemblance to the former, but is, in facility of expression, much superior to it. Like the Roman, it retains the primitive symbols for the first three digits, and like it also expresses the last four by prefixing a new symbol to the symbols for the first four, and the analogy is continued up to 'twenty.' From this point onwards, the Chinese system departs from the 'additive' principle, as 20, 30, &c., are represented not as in the Roman system by a repetition of the symbol for 10, but by affixing to the symbol for 10, on its

# NOTATION.

left side, the symbols for 2, 3, &c., as multiples. The same method is adopted with the numbers 200, 300, &c.; and should the number contain units, they are annexed on the right-hand side. For small numbers up to 20, the Roman notation is more expeditious, on account of the greater simplicity of its characters; but for very large numbers, the Chinese is scarcely more cumbersome than our own. Some numbers which are expressed by the Chinese with 14 characters, require more than 100 symbols when expressed in the Roman notation.

Previous to the intercourse of the Western European nations with China, their notation was much more cumbersome than it is at present; but the changes since made have affected merely the form of the characters, without altering the principle of the system.

**Artificial Systems.**—The first of these, in point of date, is the Hebrew; but as the knowledge we possess of it is very meagre, and as its principle was adopted by the Greeks in the construction of their improved system, it will be sufficient to describe the latter.

**Greek System.**—The Greeks at first used a method similar to the Romans, though at the same time they appear to have employed the letters of the alphabet to denote the first 24 numbers. Such a cumbersome system was naturally distasteful to so fastidious a race, and they hit upon the happy expedient of dividing their alphabet into three portions—using the first to symbolise the 9 digits, the second the 9 tens, and the third the 9 hundreds. But as they possessed only 24 letters, they had to use three additional symbols; their list of symbols of notation then stood as follows:

Units.	Tens.	Hundreds.
$\alpha$ represents 1	$\iota$ represents 10	$\epsilon$ represents 100
$\beta$ . . . . . 2	$\kappa$ . . . . . 20	$\sigma$ . . . . . 200
$\gamma$ . . . . . 3	$\lambda$ . . . . . 30	$\tau$ . . . . . 300
$\delta$ . . . . . 4	$\mu$ . . . . . 40	$\upsilon$ . . . . . 400
$\epsilon$ . . . . . 5	$\nu$ . . . . . 50	$\phi$ . . . . . 500
$\zeta$ (introduced) 6	$\xi$ . . . . . 60	$\chi$ . . . . . 600
$\eta$ . . . . . 7	$\theta$ . . . . . 70	$\psi$ . . . . . 700
$\theta$ . . . . . 8	$\pi$ . . . . . 80	$\omega$ . . . . . 800
$\theta$ or $\vartheta$ . . . 9	$\varsigma$ or $\zeta$ (introduced) 90	$\varnothing$ , $\Lambda$ , $\bar{\Lambda}$ (introduced) 900

By these symbols, only numbers under 1000 could be expressed, but by putting a mark, called *iota*, under any symbol, its value was increased a thousandfold, thus  $\epsilon = 1000$ ,  $\epsilon\iota = 20,000$ ; or by subscribing the letter M, the value of a symbol was raised ten-thousandfold, thus,  $\epsilon_M = 80,000$ . For these two marks, single and double dots placed over the symbols were afterwards substituted. This improvement enabled them to express with facility all numbers as high as 9,990,000, a range amply sufficient for all ordinary purposes. Further improvements were made upon this system by Apollonius, who also by making 10,000 the root of the system, and thus dividing the symbols into tetrads, greatly simplified the expression of very large numbers. Both Apollonius and Archimedes had to a certain extent discovered and employed the principle of giving to symbols values depending on their position and multiplicative of their real value, but this principle was applied to tetrads or periods of four figures only, and the multitude of symbols seems to have stood in the way of further improvement. Had Apollonius, who was the chief improver of the system, discarded all but the first nine symbols, and applied the same principle to the single symbols which he applied to the 'tetrad' groups, he would have anticipated the decimal notation.

The Greek arithmetic, founded upon such a system of notation, was necessarily lengthy and complicated in its operations, each number in the multiplicand forming with each number in the multiplier a separate product (not as in our system, where a product blends with another by the process of 'carrying'), though by arranging these products in separate columns, according as they amounted to units, tens, hundreds, &c., the process was somewhat simplified. But when fractions formed part of the multiplier and multiplicand, the Greek arithmetic became almost unmanageable, till the invention of SEXAGESIMALS (q. v.) by Ptolemy superseded it. After Ptolemy's death, all improvement was arrested.

**Decimal System.**—The decimal system, which was introduced into Europe from the East (see NUMERALS), was first employed by the Spaniards, and was from them transmitted to the French and Germans, through whom its use was extended over Europe. The modern arithmetic was not practised in England till about the middle of the 16th c., and for a long time after its introduction was taught only in the universities. The decimal system, possessing only 9 symbols—viz., 1, 2, 3, 4, 5, 6, 7, 8, (called the nine digits)—adopts the principle of giving to each symbol or 'figure' two values: one the absolute value, and the other a value depending upon its position. The numbers from 'one' to 'nine' inclusive are expressed by the nine digits; ten is expressed by writing a cipher or zero after 1 (10), thus throwing it into the second place, and giving it a positional value ten times its absolute value. From the principle that a figure thus moved one place to the left is held to be increased in value ten times, this method of notation is called decimal notation (Lat. *decem*, ten), and *ten* is said to be the 'radix' of the system. The numbers from 'eleven' to 'nineteen' inclusive are expressed by taking the symbol 10 and putting the digits from 'one' to 'nine' inclusive in place of the zero—e.g., twelve is written 12, 1 in position signifying ten units, and 2, two additional units. On the same principle, twenty is expressed by putting 2 in the second position (20), and so on to 99. To express a hundred, 1 is put in the third place (100), thus making its value ten times what it is in the second place, or ten times ten units; two hundred is similarly expressed by 200, &c.; and should a number of tens and units amounting to less than a hundred exist in the number, the symbols expressing them are substituted for the two zeros. This process can be similarly continued without limit.

There is another way of looking at this notation which is perhaps simpler and clearer. In such a number, e.g., as 333, instead of attributing different values to the figure 3 in the different positions, we may consider it as symbolising the same number throughout, namely, *three*; but *three what*? In the first place, it signifies three ones or units (e.g., three single pounds or sovereigns); in the second place it still signifies three, but now it is three 'tens' or decades (three parcels of ten sovereigns each); and in the third place, it still signifies three, but now three hundreds (three parcels of a hundred each). It is from this point of view that the first place to the right is called the *place of units*, or the *unit place*; the second, the *place of tens*, and so on. When such a number as 6473 is analysed on this principle, it is seen to mean  $6 \times 1000$  (6 times 1000) +  $4 \times 100$  +  $7 \times 10$  +  $3 \times 1$ ; and 6000 becomes  $6 \times 1000 + 4 \times 1$ . In this latter instance the peculiar importance of the figure 0 is seen (see NOTHING). Following out the method, the general formula for all numbers is  $a \times 10^m + b \times 10^{m-1} + c \times 10^{m-2} + \dots + m \times 10^2 + n \times 10^1 + p \times 1$ .

+  $q$ , where  $a, b, c, \dots, m, n, p, q$ , stand for any of the nine digits or zero.

The special advantages of such a system are manifold. It enables us to express small numbers with the greatest ease, and as the smaller numbers are those most commonly used, this is a great point in favour of the system. It also gives to computation a unity which could never under any circumstances have existed in the systems of notation above described, and the most ordinary, and at the same time effective, illustration of this is the process of 'carrying' in multiplication, whereby one product is blended with another, and much time and trouble in the subsequent addition is saved. This simplification, however, is chiefly due to the introduction of the symbol 0, which, supplying the place of an absent digit, preserves to those figures on the left of it their true positional value. Another advantage of this system is the ease with which computations involving fractions are performed (see FRACTIONS, DECIMAL). The use of the number 10 as *radix*, is universal in all systems of notation; but it has been often doubted, and in some respects with good reason, whether it is the number best fitted for this position, and many have proposed to substitute 12 for it. This question will be referred to under SCALES OF NOTATION.

2. SYMBOLICAL NOTATION, the general designation of those symbols which are used by mathematicians to express indefinite quantities. The symbols are generally taken from the English, Roman, and Greek alphabets, and are apportioned as follows: Algebraic quantities are expressed by the English alphabet; those which are known, by the earlier letters  $a, b, c, \dots$ , and those which are unknown, by the later ones,  $u, v, w, x, y, \dots$ . In Trigonometry, the letters  $a, b, c, \dots$  denote measures of length, and  $A, B, C, \dots$  are used to express angles. In Mechanics and Astronomy, the Greek letters are generally used to express angles. When different sets of quantities are similarly related among themselves, the sets are, for convenience, expressed by the same letters; and to prevent confusion, each set has a peculiar mark attached to each symbol, thus,  $a, b, c, \dots$  denote one class;  $a', b', c', \dots$  another class;  $a'', b'', c'', \dots$  a third class; and so on; or,  $a_1, b_1, c_1, \dots, a_2, b_2, c_2, \dots$  &c.

NOTE, in Music, a character which by the degree it occupies on the staff represents a sound, and by its form the period of time or duration of that sound. The notes commonly in use in modern music are the semibreve,  $\circ$ ; minim,  $\text{q}$ ; crotchet,

$\text{f}$ ; quaver,  $\text{p}$ ; semiquaver,  $\text{g}$ ; demisemiquaver,  $\text{h}$ ;

and semi-demisemiquaver,  $\text{i}$ . Taking the semibreve

as unity, the minim is  $\frac{1}{2}$  its duration, the crotchet  $\frac{1}{4}$ , the quaver  $\frac{1}{8}$ , the semiquaver  $\frac{1}{16}$ , the demisemiquaver  $\frac{1}{32}$ , and the semi-demisemiquaver  $\frac{1}{64}$ . Notes of greater length than the semibreve were formerly in use—viz., the breve, twice the duration of the semibreve; the long, four times; and the large, eight times the semibreve. Of these the breve,  $\text{b}$  or  $\text{S}$ , is still sometimes met with in ecclesiastical music.—The term note is often used as synonymous with musical sound.

NOTHING, in Mathematical language, denotes the total absence of quantity or number, as when equals are subtracted from equals, but it is often employed (see LIMITS) to indicate the limit to which a constantly decreasing positive quantity approaches. The absence of number or quantity could be equally well signified by the absence of

any symbol whatever; but the presence of '0' shews that in its place some number or quantity might, and under other circumstances would, exist.

In Physics, the symbol '0' is generally denominated zero, and has a different meaning. Like the former, it is the starting-point from which magnitude is reckoned; but while the starting-point in the former case was absolute, in this case it is conventional, and by no means denotes the absence of all quantity or magnitude. Thus the zero-point of the thermometer must not be interpreted to signify that when the mercury has fallen to this point atmospheric heat has totally vanished, but must be understood as a mere conventional starting-point for graduation, chosen for convenience, and not even necessarily representing any fixed natural degree of temperature.

NOTICE TO QUIT, is the formal notice given by a landlord to a tenant, or by a tenant to a landlord, that the tenant ought or intends to quit at a future day named. See LANDLORD AND TENANT.

NOTO, a town of Sicily, in the province of Syracuse, and 16 miles south-west of the city of that name, 3 miles from the sea. It is of the highest antiquity, was a place of great strength under the Saracens, and held out against the invading Northmen longer than any other town of Sicily. It is a very handsome town, contains rich churches, beautiful palaces, and broad and straight streets. Its academy has a library attached, and a collection of antiquities. A good trade is carried on in corn, wine, oil, and the other produce of the vicinity. Pop. 14,619. N. was destroyed by an earthquake in 1693, and rebuilt about  $4\frac{1}{2}$  miles from its former site.

NOTRE DAME, i.e., *Our Lady*; the old French appellation of the Virgin Mary, and therefore the name of a number of churches dedicated to the Virgin Mary in different parts of France, and particularly of the great cathedral of Paris.

NOTTINGHAM, a municipal and parliamentary borough of England, capital of the county of the same name, and a county in itself, on the Leen at its junction with the Trent, 130 miles north-north-west of London. It is built principally on the slope and at the foot of a rocky eminence, and in an architectural sense it has within recent years been much improved. The market-place is  $5\frac{1}{4}$  acres in extent, and is surrounded by lofty buildings. The Trent, which passes about a mile south of the town, and is here about 200 feet wide, is crossed by railway bridges, and by an ancient bridge of 19 arches. The exchange, the town and county halls, the House of Correction, St Mary's Church, the Roman Catholic Chapel, and the new Free Grammar-school erected in 1863, are edifices worthy of special mention. The Free Grammar-school, with an income from endowment of about £1000 a year, was founded in 1513. A free library was opened in April 1868. There are numerous hospitals for the poor and infirm. Of the manufactures, which are various and important, the principal are bobbinet and lace, and cotton and silk hosiery. Cotton, silk, and flax mills, bleaching-works, and wire, iron, and brass works are in operation. N., which sends two members to parliament, is on the Darby and Lincoln Railway. Pop. (1871) 86,621.

The original castle of N. was built by William the Conqueror; it was dismantled during the Protectorate, and replaced by the present edifice—a castle only in name.

NOTTINGHAM, an inland county of England, between Lincolnshire on the east, and Yorkshire and Derbyshire on the west. Area, 526,176 acres; pop. 319,753. It is 50 miles in length from north

to south, and 20 miles in average breadth. The meridian of 1° west falls along the middle of the county, and may be said to divide it into two nearly equal portions, of which the eastern, comprising the vale of the Trent, is level, and the western is occupied by hills of no great elevation. In the south of the county are the wolds, consisting of upland moors and pasture-lands, broken up by many fertile hollows. In the west are the remains of the royal forest of Sherwood, famous as the chief haunt of Robin Hood. The principal rivers are the Trent, and its tributaries the Erewash, Mann, and Idle. The Nottingham and Grantham Canal in the south connects the Trent with the Witham, and these two rivers are also connected by the Fosse Dyke Canal, which, running north-west from the city of Lincoln, joins the Trent on the north-eastern boundary of the county. By the rivers, canals, and the North Midland, Sheffield and Lincoln, and Great Northern Railways, there is direct communication in every direction. The climate, especially in the east, is remarkably dry. The soil is various; and, with regard to productiveness, the land is not above mediocrity. The usual crops are raised; there are many hop-plantations, and much land is laid out in market-gardens. Extensive tracts have been planted recently. Four members of parliament are returned for the county.

NOUKHA, a town of Russia, in Trans-Caucasia, is built on the southern slope of the Caucasus Mountains, 80 miles south-west of Derbend, in lat. 41° 12' N., long. 47° 13' E. Pop. 23,371, consisting of native Tartars belonging to the Mohammedan creed, of Armenians, and a few Russians, chiefly officials. Breeding the silk-worm is the staple branch of industry. The native breed of silk-worms is somewhat coarse, and is now being supplanted by the Italian breed.

NOUN (Lat. *nomen*, a name), in Grammar, is the term applied to that class of words that 'name' or designate the persons and things spoken about. In a wide sense, such words as *rich*, *tall*, are nouns, as well as *John*, *man*, *tree*; for they are names applicable to all objects possessing these attributes. But as words like *John*, *man*, *tree*, suffice of themselves to mark out or designate an object or a definite class of objects, while words expressive of a single attribute, like *rich*, *tall*, can be used only in conjunction with such a word as *man* or *tree*, the one class are called Adjective Nouns, or simply Adjectives (q. v.), while the other are called Substantive Nouns, or simply Substantives or Nouns. Nouns or Names, in this narrower sense, may be divided into classes in a variety of ways, according to the ground we take for our division. One of the distinctions commonly made by grammarians is into Proper Nouns and Common Nouns. A proper noun is usually defined to be 'the name of any individual person, or place,' as *John*, *London*; while a common noun is applicable to every individual of a class of objects, as *prince*, *city*. But this definition fails to point out the real difference; for there are several Londons, and there are more Johns than princes; other things also have proper names, besides persons and places, as ships (the *Minotaur*), and bells (Big Ben). Providence, again, although applicable to only One Being in the universe, is not a proper noun. Wherein, then, lies the difference? In order to answer this question, we must advert to an important distinction made by logicians with regard to the import of names. A word is said to denote all the objects to which it is applicable as a name; thus, the word *man* is a name for all the objects known individually as James, John, Adam, Cæsar, &c., and therefore denotes the whole human race;

but while thus denoting or naming them, it also implies something concerning them; in the language of logic, it *connotes* that they possess certain attributes, namely (1) a certain corporeal form, known as the human form; (2) animal life; (3) rationality. All this, at least, is included in the meaning or connotation of the word 'man.' Now, if we consider any noun of the class called common, we find that while it denotes, or names, or points out a certain object, or class of objects, it also conveys or implies some qualities or facts concerning them; in other words, all such names are *connotative*, or have meaning. Not so with proper nouns. To say that a man is called John Butler, informs us of no quality he possesses, or of any fact except that such is his name. The name itself conveys no meaning; it is *non-connotative*. And this is what really constitutes a proper name; it is affixed to an object, not to convey any fact concerning it, but merely to enable you to speak about it. Proper names, indeed, are often given at first on account of the object possessing certain attributes; but once given, they do not continue to connote those attributes. The first John Baker was probably so called because he exercised the trade of baking; but his ceasing to bake would not have made him lose the name, and his descendants were called Baker, regardless of their occupation.

Proper names are thus *meaningless marks*, to distinguish one individual from another; and the B, C, &c., which a geometrician affixes to the several angles of a figure, are as much proper names. Tom, Lawrie, &c., applied to the individual being of a chime. The proper contrast, then, to a Proper Noun is not a Common Noun—meaning by that name common to a class of objects—but a Significant Noun.

Of Significant Nouns, by far the greater number are General or Class Names; that is, they can be applied to any individual of a class of objects, implying that all these individuals have certain attributes in common—as *quadruped*, *book*. The word *quadruped* spoken of may perhaps be a *horse*; but here we have another class-name, applicable to the same object, but of less generality than 'quadruped.' *Animal*, again, is more general than *quadruped*, being applicable to a far wider class. But it is important to observe, that as the number of objects to which the terms are applied to, or denote, increases, the number of attributes they imply—in other words, the amount of their meaning—diminishes. To call an object an 'animal,' merely implies that it is organised and is alive (with that kind of life called animal life); to call it a 'quadruped,' implies all this and a number of attributes in addition; as to call it a 'horse,' implies a still further addition.

It is to this class of words that the term *Common Nouns* is properly applicable; and the contrast to them is not Proper Nouns, but what might be called Singular Nouns, such as 'God,' 'providence,' 'universe.'

*Collective Names* are such as *regiment*, *fleet*, *school*. They form a subdivision of Class Names or Common Nouns; for *regiment* is applicable to all collections of men organised in a particular way.

*Names of Materials* are such as *iron*, *water*, *oxygen*, *wheat*. These two classes appear in many cases to merge into each other. In both, the objects named consist of an aggregation; but in collective names the parts forming the collection are thought of as individual objects; as the *soldiers* of a regiment, the *fishes* composing a shoal. Substances, again, like iron, gold, water, are not made up of definite individual parts (at least to our senses); and such as wheat, sand, the name of the individual visible part (*grain of wheat*, *grain of sand*) is

derived from the name of the mass, shewing that the idea of the individual is swallowed up in that of the mass.

A convenient term for names of materials or substances is that used by German grammarians—*Stuff-nouns*. Sometimes the same word is used as a *stuff-noun*, and also as a *class-noun*. Thus: 'The cow eats *grass*' (*stuff-noun*); 'The botanist studies the *grasses*, and has found a new *grass*' (*class-noun*); 'They had *fish* (*stuff-noun*) for dinner, and consumed four large *fishes*' (*class-noun*).

Names of materials are not, like collective nouns, a subdivision of common nouns; they belong to the contrasted class of singular nouns; and, when the substance is simple or invariable in composition, cannot be used in the plural; as *gold*, *water*, *beef*.

*Abstract Nouns*.—In the expression 'hard steel,' or 'the steel is hard,' the word *hard* implies a certain quality or attribute as belonging to the steel. This quality has no existence apart from steel or some other substance; but I can withdraw (*abstract*) my thoughts from the steel in other respects, and think of this quality as if it had an independent existence. The name of this imaginary existence or abstraction is *hardness*. All words expressive of the qualities, actions, or states of objects, have abstract nouns corresponding to them; as *brave*—*bravery*; *strike*—*stroke*; *well*—*health*. In opposition to abstract nouns, all others are *concrete nouns*—that is, the attributes implied in them are considered as embodied in (*concrete*, Lat. growing together) the actual existences named.

**NOUREDDIN-MAHMÚD, MALEK-AL-ADEL**, one of the most illustrious men of his time, and the scourge of the Christians who had settled in Syria and Palestine, was born at Damascus, 21st February 1116. His father, Omad-ed-din Zengui, originally governor of Mosul and Diarbekir on behalf of the Seljuk sultans, had established his independence, and extended his authority over Northern Syria, including Hems, Edessa, Hamah, and Aleppo. N. succeeded him in 1145, and the better to carry out his ambitious designs, changed the seat of government from Mosul to Aleppo. Count Joscelin of Edessa, thinking the accession of a young and inexperienced sovereign afforded him a favourable opportunity of regaining his territories, made an inroad at the head of a large force, but was signally discomfited under the walls of Edessa, his army, with the exception of 10,000 men, being completely annihilated. The report of N.'s success being conveyed to Western Europe, gave rise to the second Crusade. The Crusaders were, however, foiled by N. before Damascus, and being defeated in a number of partial conflicts, abandoned their enterprise in despair. N. next conquered Tripolis and Antioch, the prince of the latter territory being defeated and slain in a bloody conflict near Ruga (29th June 1149), and before 1151 all the Christian strongholds in Syria were in his possession. He next cast his eyes on Egypt, which was in a state of almost complete anarchy under the feeble sway of the now effeminate Fatimites, and, as a preliminary step, he took possession of Damascus (which till this time had been ruled by an independent Seljuk prince) in 1156; but a terrible earthquake which at this time devastated Syria, levelling large portions of Antioch, Tripolis, Hamah, Hems, and other towns, put a stop to his scheme for the present, and compelled him to devote all his energies to the removal of the traces of this destructive visitation. An illness which prostrated him in 1159, enabled the Christians to recover some of their lost territories, and N., in attempting their re-subjugation, was totally defeated near the Lake of Gennesareth by Baldwin III., king of Jerusalem;

but undismayed by this reverse, he resumed the offensive, defeated the Christian princes of Tripolis and Antioch, making prisoners of both, and again invaded Palestine. Meanwhile, he had obtained the sanction of the calif of Bagdad to his projects concerning Egypt, and the true believers flocking to his standard from all quarters, a large army was soon raised, which, under his lieutenant Shirkoh, speedily overran Egypt. Shirkoh dying soon after, was succeeded by his nephew, the celebrated Salah-ed-din (q. v.), who completed the conquest of the country. N., becoming jealous of his able young lieutenant, was preparing to march into Egypt in person, when he died at Damascus, 15th May 1174. N. is one of the great heroes of Moslem history. Brought up among warriors who were sworn to shed their blood for the cause of the Prophet, he retained in his exalted station all the austere simplicity of the first califs. He was not, like the majority of his co-religionists, a mere conqueror, but zealously promoted the cultivation of the sciences, arts, and literature, and established a strict administration of justice throughout his extensive dominions. He was revered by his subjects, both Moslem and Christian, for his moderation and clemency, and even his most bitter enemies among the Christian princes extolled his chivalrous heroism and good faith. He possessed in an eminent degree the faculty of impressing his own fiery zeal for the supremacy of Islam upon his subjects, and their descendants at the present day have faithfully preserved both his name and principles.

**NOVA SCOTIA**, a province of the Dominion of Canada, is bounded on the N.-W. by New Brunswick and the Bay of Fundy, on the N. by the Straits of Northumberland and the Gulf of St Lawrence, and on the other sides by the Atlantic Ocean. It consists of two portions, N. S. proper, a large peninsula connected with New Brunswick by an isthmus about 15 miles in width, and the island of Cape Breton (q. v.). The peninsula, about 280 miles in length, and from 50 to 100 miles broad, extends in an east-north-east and west-south-west direction. Cape Breton lies north-east of N. S. proper, separated from it by a narrow strait, called the Gut of Canso, 16 miles long, and from half a mile to 2 miles wide. Sable Island, which is 25 miles in length by 1½ in breadth, and is surrounded by a dangerous, widely-extended sand-bank, is situated about 90 miles from the nearest coast of N. S., in lat. 44° N., and long. 60° W. It is formed of sand-hills thrown up by the sea, some of them being about 80 feet in height. The island is covered with wild grasses, which support herds of wild horses, known as Sable Island ponies. It is in the track of vessels trading between America and Britain, and owing to the number of wrecks that take place on its shores, a superintendent and several men are stationed here for the purpose of rescuing and aiding shipwrecked mariners. The area of the province is 18,600 square miles; pop. (1871) 387,800. The coast-line is about 1000 miles in length, and the shores, which are much indented, abound in excellent bays and harbours, of which the chief are Chedabucto Bay, Halifax Harbour, St Margaret's, Mahon, and St Mary's Bays, Annapolis, Mines, and Chignecto Basins, and Pictou Harbour. There are numerous rivers, but few of them are over 50 miles in length; the most important are the Avon, the Annapolis, and the Shubenacadie. N. S. contains about 400 lakes, of which the Bras d'Or, in Cape Breton, covers an area of 500 square miles, or about one-sixth of the entire area of the island. Stretching along the Atlantic sea-board, and extending inland from it for about 20

excluded such sinners from all hope of heaven, yet they denied the lawfulness of re-admitting them to the communion of the church. This doctrine they extended at a later period to all grievous sins, of whatever character. N. may thus be regarded as the first antipope. The churches throughout Italy, Africa, and the East adhered to Cornelius; but the N. party set up bishops and established churches not only at Carthage, but at Constantinople, Alexandria, Nicomedia, Phrygia, Gaul, Spain, and elsewhere. They claimed for themselves a character of especial purity, and assumed the appellation of Cathari (Puritans). The time and manner of the death of N. is uncertain. According to Socrates (*Hist. Ecc.* iv. 28; v. 21; vii. 5, 12, 25), he died a martyr in the persecution of Valerian, but this is improbable. He was a man of considerable learning, and the work recently discovered in one of the monasteries of Mount Athos, and published by Mr Miller at Oxford in 1851, under the title of *Origenis Philosophumena*, is by some ascribed to him. His sect survived long after his death. An unsuccessful effort was made in the council of Nice to re-unite them to the church; and traces of them are still discoverable in the end of the 6th century.

NOVELLÆ. See JUSTINIAN.

NOVELS. The novel and the so-called romance, inasmuch as they constantly merge in one another, and are only superficially distinguished by the preponderance in the one of ordinary and familiar incidents, in the other of incident more or less remote and marvellous, may conveniently be included here under the common definition of prose narrative fiction. Between the legendary epic, the drama into which portions of its available material from fluent become crystallised, and the wider prose fiction or novel, into which this again expands itself, there are obvious affinities, the distinctions being rather of form than of essence. It is of the later development, the novel, that we purpose to give here a historical sketch, omitting, however, any consideration of the remoter and but slightly known specimens produced in Hindustan and China.

1. *Ancient Classical Prose Fiction*.—The earliest Greek compositions of a fictitious character, of which we possess any knowledge, are the *Milesiaca*, or *Milesian Tales*, said to have been written chiefly by one Aristides. The Milesians were a colony of Ionic Greeks who settled in Asia Minor, and fell under the dominion of the Persians, 494 B.C. They were a voluptuous, brilliant, and inventive race, and are supposed to have caught from their eastern masters, whom they somewhat resembled, a liking for that particularly oriental species of literature—the imaginary story or narrative. None of the Milesian Tales are extant, either in the original Greek or in the Latin version made by Sisenna, the Roman historian, about the time of Marius and Sulla; but we have some forty stories by Parthenius Nicaeus, which are considered to be to a certain extent adaptations from them. The collection of Parthenius is entitled *Peri Erotikôn Pathêmatôn*, and is dedicated to Cornelius Gallus, the Latin poet, and the contemporary and friend of Virgil. If we may judge from this later set of fictions, which are mainly concerned with the description of all sorts of seduction, of criminal and incestuous passions, and of deplorable terminations to wretched lives, we have little cause, either morally or aesthetically, to regret the loss of their more famous prototypes. In Greece Proper, nothing was done, so far as we know, in the way of novel or romance, until after the age of Alexander the Great. It has been conjectured, not improbably,

that his Eastern conquests had a potent effect in giving this new bent to the fancy of his countrymen. Clearchus, a disciple of Aristotle, wrote a history of fictitious love-adventures, and is thus, perhaps, to be considered the first European Greek novelist, and the first of the long series of *Erotikoi*, who reach down to the 13th c. after Christ. Not long after came Antonius Diogenes, whose romance, in 24 books, entitled *Ta hyper Thoulên Apista* (Of the Incredible Things beyond Thule), was founded on the wanderings, adventures, and loves of Dinias and Dercyllis. It appears to have been held in high esteem, and was at least useful as a store-house, whence later writers, such as Achilles Tatius, derived materials for their more artistic fictions. The work has not been preserved, but Photius gives an outline of its contents in his *Bibliotheca Cod.*

A long interval, embracing, indeed, several centuries, now elapses before we come upon another Greek novelist or romancist. Be the cause of this what it may, the ever-increasing luxury and depravity of the pagan imperial world, combined to develop and intensify that morbid craving for horrible, magical, and supernatural incidents, which in general fill the pages of the romancists of the empire. The first names that occur in the new series are Lucius of Patra (*Patrensis*) and Lucian (q. v.), who flourished in the 2d c. A.D., during the reign of Marcus Antoninus; but as the former simply collected accounts of magical transformations (*Metamorphoses*), he is perhaps not to be regarded as a novelist proper at all; while the latter was really a humorist, satirist, and moralist in the guise of a story-teller—in a word, a classic Rabelais and Heine, and as far as possible from being a member of the wonder-loving school of Erotics, with whom he has only an accidental connection by the external form of some of his writings. The first of the new series of romance writers, strictly so called, is properly Iamblichus (not the Neo-Platonic philosopher), whose *Babylonica* is, indeed, no longer extant; but we are able to form a pretty just estimate of it from the epitome of Photius. The next notable name is that of Heliodorus (q. v.), Bishop of Trikka, who flourished in the 4th c. A.D. This Christian writer, whose *Loves of Theagenes and Charicleia* is really the oldest extant erotic romance, has far excelled all his predecessors in everything that can render a story interesting or excellent, and his charming fiction obtained a great popularity among such as could read. Some imagine that they see in Heliodorus a resemblance to the minutely descriptive style of novel introduced into England by Richardson; but without adopting this rather extreme notion, it can at least be safely asserted, that Achilles Tatius and all the subsequent *Erotikoi* deliberately imitated his style and manner, while he was not less certainly used as a model by that once celebrated but dreadfully tedious school of heroic romance which flourished in France during the 17th c., and whose best-remembered representative is Mademoiselle de Scudéri. Tasso, Guarini, D'Urfé, and several other modern writers, have drawn many particulars—sometimes almost *verbatim*—from the stories in the *Theagenes and Charicleia*. Achilles Tatius (q. v.), probably belonging to the 5th c., ranks next to, but at some distance from, Heliodorus in point of merit. His romance, entitled *Ta kata Leukippen kai Kleitophonta*, and consisting of eight books, has supplied incidents to more than one Italian and French writer.

The next work that invites our attention in point of time, the *Daphnis and Chloe* of Longus, is of a totally different character. It is a simple and

civilisation of the modern world—were boundlessly ignorant, credulous, and wonder-loving. Their prodigious vigour and vehemence of character having no proper intellectual *pabulum*, was forced to supply its craving for a knowledge which was beyond its immediate attainment, by the exaggerations of a fancy that was without law or limit. We need not go so far as to assert that, in the medieval romance, everything is of native or 'Gothic' origin; the fact is very much the reverse. This extreme theory, propounded by Mallet, and supported by Bishop Percy and other writers, is totally inadequate to account for all that is contained in these romances. Not less inadequate is another theory, first suggested by Salmasius, and afterwards elaborated by Warton, that the medieval romance is mainly of Saracenic origin, and was probably introduced by the Moorish conquerors into Spain, and thence propagated into France and Britain; while a third theory, which has also found supporters, viz., that it was derived from the classical mythology of ancient Greece, is the most inadequate of all. The true explanation of the matter appears to be, that medieval romance had its root and foundation in Chivalry (q. v.)—a genuine product of Western Europe—and although the machinery, so to speak, the exploits and the marvels, may have often been derived from the foreign sources we have mentioned, yet the spirit, scenery, sentiment, and life of the legends thoroughly reflect the characteristics of the earlier ages of feudalism. The notions of dragons, giants, magic rings, enchanted castles, are probably of Saracenic origin, and may have been introduced into Europe by the horde of pilgrims who visited the East in the time of the Crusades; such incidents as the detaining of a knight from his quest by the enchantments of a sorceress, may have been a tradition of the *Odyssey* of Homer; but the gallantry, the courtesy, the romantic valour, the tournaments, the noble friendships of brother-knights—all that distinguishes the romances of chivalry from Runic legends or the *Arabian Nights*, cannot be traced to any other source than the new-born chivalry of Europe.

The medieval romances are divisible into three great series: 1. Those relating to Arthur and the Knights of the Round Table; 2. Those relating to Charlemagne and his Paladins; 3. Those relating to Amadis de Gaul and his descendants.

The Arthurian series is, in its essence, of Welsh and Armorican origin. Its genesis is as follows. First came the legendary chronicles composed in Wales or Brittany, such as the *De Excidio Britannia* of Gildas (q. v.); the chronicle of Nennius, belonging to the 9th c.; the Armorican collections of Walter Calenius or Gualtier, Archdeacon of Oxford; and the famous *Chronicon sive Historia Britonum* of Geoffrey of Monmouth (q. v.)—from these, and from the multitude of floating unrecorded traditions, sprung the metrical, which in turn gave birth to, and were ultimately superseded by, the prose romances. It is with the latter alone we have here to do. They, like the metrical romances, were composed by Anglo-Norman authors (whose names are unknown) during the 13th, 14th, and 15th centuries, who took all the more willingly to the old British legends, that in these the 'Saxons' were the objects of the authors' hatred and detestation. The principal romances of the Arthurian cycle are those of *Merlin* (q. v.), the enchanter; of *Arthur* (q. v.); of the Sangreal (see GRAAL); of *Perceval*; of *Lancelot du Lac*; of the princes of Lyonesse, *Meliadus* and his son *Tristan*; and of *Isaie le Triste*, the son of Tristan. They relate the marvellous adventures, exploits, loves, and gallantries of the Knights of the Round Table, and are probably in substance the

oldest of the medieval prose romances. The scenes are generally laid in Wales, Cornwall, Brittany, Ireland, or Scotland; only in one or two of the series are we taken as far as Egypt or India; and though Arthur is slain by 'Saracens' who supported his nephew, Mordred, and a general eastern colouring is present in the cycle, yet it is 'Saxons' who are his principal foes.

The series of Charlemagne and his Paladins is of purely French origin, and originated in a somewhat similar fashion to the Arthurian cycle; that is to say, there was first a legendary chronicle (in verse, however), entitled *Historia de Vita Caroli Magni et Rolandi*, erroneously attributed to Turpin or Tilpin, Archbishop of Rheims, and contemporary of Charlemagne, but probably executed in the 11th or 12th c.; then came a series of metrical romances, strictly so called, which were gradually supplanted by their prose counterparts, the authors of which last, however, appear to have diverged more from the metrical originals, and to have been more free and fanciful than their predecessors of the Arthurian cycle. The principal are *Huon of Bordeaux* (the incidents of which are followed by Wieland in his *Oberon*), *Guerin de Monglave*, *Gaylen Rhetoré* (in which Charlemagne and his Paladins proceed incognito to the Holy Land), *Miles and Ames*, *Jourdain de Blaves*, *Doolin de Mayence*, *Ogier le Danois*, and *Maugis the Enchanter*. In these romances we are, in some respects, on totally different ground from that on which we find ourselves in the Arthurian series. We are transferred to the East—to Africa, Palestine, Arabia, Bagdad, Constantinople, India, Persia, the Caspian Sea, &c. We are introduced to the courts of Saracen 'princes,' 'sultans,' and 'emirs,' and see Mohammedan maidens of peerless beauty falling in love with Christian knights, and for their sakes abandoning, or even betraying father, mother, brethren, and kinsmen. Fairies, who figure but slightly in the Arthurian romances, play a frequent and an important part in these; demons, dervishes, apes, talismans, palaces with cupolas and gilded roofs, splendid jewels, diamonds, &c.—everything, in fact, shews the influence exercised on the imagination of Western Europe by the glowing scenery, the brilliant life, and the gorgeously fanciful superstitions of oriental lands.

The series relating to Amadis de Gaul and his descendants is sufficiently characterised under the head of *AMADIS* (q. v.). We may only observe, as a proof of the comparative lateness of their composition, that the 'Saracens' of the French romances here give place to 'Turks;' and as the eyes of Europe were turned towards the tottering Greek empire, many of the scenes of warfare are laid at Constantinople.

Besides the three distinct series of romance above mentioned, a fourth perhaps deserves mention, in which the heroes of antiquity are grotesquely tricked out in the costume of medieval knights. The exact date of their composition cannot be ascertained, but they were probably later in general than any of the other three series; and, at any rate, were for the most part not published till the end of the 15th and the beginning of the 16th centuries. The principal are the romance of *Jason and Medea*, of *Hercules*, of *Edipus*, and of *Alexander*. They are all written in French, and the first two profess to be the work of a Raoul le Febvre. An attempt is made to adhere, in the general outline of the stories, to the ancient myths, but most marvellous embellishments are added, such as only the middle ages could have conceived; while the transformations that the classical personages undergo are exceedingly ludicrous. Jove becomes a 'king;' Mercury, his 'squire;' the

performs the most degrading offices for the most worthless characters.

*Romance of the 16th and 17th Centuries.*—During the middle ages, the universal sway of the church and the institutions of feudalism gave a certain character of uniformity to the modes of life, and thereby to the social literature of Western Europe; but after the epoch of the Reformation, and even earlier, this uniformity disappears, and we find in every direction a tendency to the opposite extreme of individualism. This tendency manifests itself especially in the fiction of the period, which, vastly increasing in quantity and varying in quality, becomes difficult to classify. We shall, however, endeavour to group the products of modern prose-fiction works under what appears to us a convenient chronological heading.

During the 16th and 17th centuries, four different kinds of romance or novel were cultivated—1. *The Comic Romance*; 2. *The Political Romance*; 3. *The Pastoral Romance*; 4. *The Heroic Romance*.

*Comic Romance* substantially begins in modern times with Rabelais (q. v.), styled by Sir William Temple the *Father of Ridicule*. Others, indeed, had preceded him in the same path, but they had acquired no celebrity. In him we see unmistakably one form of the modern spirit—its daring freedom of speculation, criticism, and satire, also that lack of reverence exhibited by those who, at the period of the Reformation, clearly discerned the abuses of the church, but had not faith in the possibility or efficacy of reforms. Thus, Rabelais, in his inimitable burlesque romance, scoffs (with the tone of a sceptic, however) at the vices of the clergy, the crooked ways of politicians, the jargon of philosophers, and the absurdities of the *contes dévots*, and of the medieval tales generally. The next remarkable romance of a comic nature is the *Vita di Bertoldo* of Julio Cesare Croce (flor. at the close of the 16th c.), a work recounting the humorous and successful exploits of a clever but ugly peasant, and regarding which we are told that for two centuries it was as popular in Italy as *Robinson Crusoe* or the *Pilgrim's Progress* in England. The substance of the story can be traced back to an oriental source. A few years later appeared *Don Quixote* (see CERVANTES), in which 'war to the knife' was proclaimed against the romances of chivalry, and in which, perhaps, we see, more distinctly than in any other fiction of the period, the new turn that the mind of Western Europe had taken. Almost contemporaneous with *Don Quixote* was another Spanish romance—Matteo Aleman's *Life of Guzman Alfarache*, successively beggar, swindler, pander, student, and galley-slave. In this work, as in others of the same sort, we find several indications of the influence of the Italian novelists. It has been supposed that *Guzman Alfarache* suggested to Le Sage the idea of *Gil Blas*, and there is some resemblance between the two; but, at any rate, it gave birth to a host of Spanish romances with beggars and scamps for heroes, of which the best is the *Lazarillo de Tormes*, by Diego de Mendoza (1586). In the following century, France produced, among others, Scarron's *Roman Comique*, and Furetière's *Roman Bourgeois*. England and Germany have nothing to shew in this department.

*Political Romance* was manifestly suggested partly by the great politico-ecclesiastical changes that took place in Europe in the first half of the 16th c., and partly by the immense increase in the knowledge of the manners and customs of remote nations, occasioned by geographical discoveries and mercantile adventure. The earliest of the series is the *Utopia* of Sir Thomas More; next comes the *Argenis* of Barclay, published in 1621; and to the

same class belong a variety of French romances produced about the close of the 17th and the beginning of the 18th c., of which by far the most famous is the *Télémaque* of Fénelon.

*Pastoral Romance.*—All through the middle ages, the fame of Virgil kept up a certain interest in compositions devoted to the delineation of rustic or shepherd life. We even find in the poems of the Troubadours several specimens of the erotic pastoral; and the *Ameto* of Boccaccio furnishes us with a prose illustration of the same. But it was after the revival of letters that this branch of fiction, so essentially classical, was most assiduously cultivated by men of scholarly genius; and though their works have not retained the popularity they originally enjoyed, they are still interesting and valuable from an historical point of view, and abound in descriptive passages of great beauty and sweetness. The pastoral life which they portray, however, never existed either in Greece or elsewhere. Their shepherds and shepherdesses are as unreal and unhistorical beings as the knights of medieval romance. The first important work of the kind is the *Arcadia* of Sannazzaro, written in Italian, about the end of the 15th century. It was followed by the *Diana* of Montemayor, written in Spanish, about the middle of the 16th c., several of the episodes of which are borrowed from the Italian novelists; while Shakspeare has in turn directly taken from it the plot of the *Two Gentlemen of Verona*, copying occasionally the very language, as well as some of the most amusing incidents in his *Midsummer Night's Dream*. The *Diana* was imitated in French by Honore d'Urfé, whose *Astrée* (1610–1625) was for a long while held in the highest esteem, and is really, in spite of its tediousness, a work of great learning and considerable merit. Twenty years before the appearance of *Astrée*, Sir Philip Sidney wrote and published his *Arcadia*, as tiresome, and in its substance as unreal, as any production of the same school, but in stateliness and melody of language, in luxury of fancy, in nobility and purity of sentiment, far exceeding them all.

*Heroic Romance* owed its origin partly to the immediate antecedent pastoral romance, partly to an increased acquaintance with classic history, produced by the translation of such books as *Plutarch's Lives*, and partly to the interest excited in the Moors of Granada by a splendid romance in Spanish (professing, however, to be a history), entitled *The Dissensions of the Zegrís and the Abencerrages*, and was printed at Alcalá in 1604, and which soon became extremely popular, especially in France. It was in the latter country alone that the *Romans de Longue Haleine* (Long-winded Romances), as they have been happily nicknamed, were cultivated. The first of this heavy series was the *Polexandre* of Gomberville, published in 1632, in which the influence of the early Greek romances is visible. His successor, Calprenède, the best of a bad lot, wrote *Cleopatra*, *Cassandra*, and *Pharamond*. But the most prolific, and consequently the most intolerable of the school, is Madame de Scudéri, whose principal romances are *Ibrahim ou l'Illustre Bassa*, *Clelie*, *Histoire Romaine*, *Artamenes ou le Grand Cyrus*, and *Almahide*. The pompous dignity, the hyper-polite address, the dreadful dullness, and the hollow ceremonialism of these ridiculous performances, admirably (if unintentionally) mirror the features of French court-life during the time of the *Grand Monarque*. The heroic romances did not long retain their meretricious reputation. Molière, and still more, Boileau in his satire *Les Héros de Roman*, *Dialogue*, ridiculed them to death, and in consequence, Madame de Scudéri had no successor.

struggle that agitated and rent England during the first half of that century, and gave an austere theological bias to society. The Puritans, in their day of triumph, would not tolerate either comic or heroic romances. They set their faces 'like flint' against all imaginative fiction, which they considered as little better than lying; and even to this day that class of people commonly described as 'the religious portion of the community,' in some sense the representatives of the Puritans, betray the legitimacy of their spiritual descent by their aversion to all sorts of secular tales. After the Restoration, however, an extraordinary change came over the English nation, or at least over the upper and wealthier classes. These rioted in the excess of a coarse and licentious reaction against the rigorous piety and fanaticism of the Commonwealth. This turbid viciousness by and by calmed down, but it left a certain taint of sensualism and materialism in the habits and life of the people, which, in the opinion of some competent critics, marks them to this day. It is certain that at the beginning of the 18th c. England was entering on the most prosaic, unimaginative, and unheroical period of her history. Its characteristics are faithfully reflected in most of her novels, which, as pictures of the gross dull life, the paltry thoughts, the low sentiments, the modish manners, and the loose morality that prevailed, possess a great historical value apart altogether from their literary merits. The first name that occurs is that of the notorious *Aphra Behn* (q. v.), the greater number of whose novels, of which *Oronoko* is the best known, appeared towards the close of the reign of Charles II., but are included here in the literature of the 18th c., as they belong to it by the nature of their contents, and not to the 17th c. types of fiction. She was imitated by Mrs Heywood (born 1696, died 1758), of whose *Love in Excess*, *The British Recluse*, and *The Injured Husband*, it has been remarked, that 'the male characters are in the highest degree licentious, and the females as impassioned as the Saracen princesses in the Spanish romances of chivalry.' A later work, however, *The History of Miss Betsy Thoughtless*, is of a higher stamp, and is supposed to have suggested the plan of Miss Burney's *Evelina*. But the first novelist of great genius belonging to the new era is Daniel

Defoe, the first novel of *Joseph Andrews* in the style of his predecessor. Like his romances, *Tom Jones* and *Amelia*, as Fielding's sharper eyes saw, were vulgar, and impure. Smollett's style of genius, continues to prevail. His chief works are, *Roderick Random*, *Pickles*, *The Adventures of Ferdinand*, and *Humphrey Clinker*. Sterne, in the same period, exhibits a peculiar, and original, that it is to class him with any of his contemporaries. *Tristram Shandy* is a work sui generis, is the coarse impurity and indelicacy conspicuous. Four years later, *The Vicar of Wakefield*, in which a new school in a moral point of view, is first seen, the exception of Richardson, all the novels mentioned are usually, and were described as *humorists*. Other novels, besides, but this is the most conspicuous. When this school was at its height, 1760—1770, another was on the rise. The publication of Percy's *Reliques* created an interest in the age of chivalry. Readers had become tired of the grossness of prosaic fiction, in spite of the efforts devoted to its illustration. It was a school and could create no more. The modern romantic school was born, whose *Castle of Otranto* appeared, followed by Clara Reeve, the *English Baron*, a romance that we hope, remembers with the best, but the greatest genius in this school was Mrs Radcliffe (q. v.), whose *Amelia* and other works, though now almost greedily devoured and almost forgotten. The ablest of her successors were Lewis, author of *The Monk* (1796), and author of *Montorio* (1803). In this school, the incidents are often terrible, and often supernatural. The scenery is in keeping with the gloomy castles, secret passages, and ghosts, haunted chambers, &c.

the idea of attempting for Scotland a series of like illustrations.

2. *French Prose Fiction in the 18th Century.*—It is not easy—perhaps not possible—to trace the causes that led to the cultivation of the different kinds of fiction which flourished in France during this century, and particularly during the first half of it. The natural love of change—of novelty; the accidental influences of foreign literature; the disposition, so peculiarly French, to satirise prevalent follies and vices; the wish, on the other hand, to amuse the leisure moments of a luxurious, superstitious, and profligate society: all these and many other causes unquestionably assisted in determining its diverse development. Four kinds have been distinguished: 1. *Pseudo-historical Romance*, the literature in which department, although copious enough, neither deserves nor requires special notice; 2. *Romance in which the incidents, though natural, are purely imaginary*; 3. *Satirico-moral Romance*; 4. *Fairy Tales*, to which may be associated the imitations of *Oriental Tales*, and the *Voyages Imaginaires*.

2. *Romance in which the incidents, though natural, are purely imaginary.*—This class more nearly corresponds with the modern conception of the novel than any of its predecessors, and probably had its prototype in *La Princesse de Clèves* and *Zaïde*, by the Comtesse de La Fayette, who flourished in the latter half of the 17th c.; but the first great name that adorns it is that of Marivaux (1688—1763), whose *Vie de Marianne* and *Payson Parvenu* were long in high favour. They have this in common with the contemporary English fiction, that everything in them is produced by ordinary means, and the interest of the reader is sought to be awakened by the vivid and powerful portraiture of natural feelings, while the incidents, if often highly romantic, are always sufficiently probable to insure the credence of the imagination. Next to Marivaux comes the Abbé Prevot, q. v. (1697—1763), who first 'carried the terrors of tragedy into the novel.' He was a most voluminous writer, but the work by which he is now chiefly remembered is *Manon L'Escaut*, recounting the adventures of a kept-mistress and swindler, the purpose of which appears to be similar to that of *La Dame aux Camélias* of Dumas fils—viz., to shew how noble, true-hearted, and self-sacrificing a prostitute may be! Other writers belonging more or less strictly to the same division are Madame Riccoboni (flor. 1750) and Rousseau (q. v.), in whose *Héloïse* we begin to see the dawn of that fierce natural impure passion, and that extravagant scorn of conventional life, that culminated in the sanguinary paroxysms of the Revolution.

3. *Humorous and Satirical Romance.*—By far the most celebrated specimens of this kind of fiction produced in France during the 18th c. are the *Gil Blas*, the *Diable Boiteux*, and *Le Bachelier de Salamanca* of Le Sage, q. v. (1668—1746), all of which were suggested by the prolific comic romancists of Spain, Juan de Luna, Quevedo, Cervantes, Espinel, from some of whom he has borrowed, with hardly any variation, whole scenes and stories, as well as from more ancient sources. The best parts, however, are his own, and the spirit of the work is thoroughly French in the gay and lightsome vivacity of its humour. It is with some hesitation that we place the younger Crebillon (q. v.) in the same category, for the licentiousness of his *Egarements du Cœur et de l'Esprit*, and other novels, is far more apparent than their satire or humour. Bastide and Diderot (q. v.) hold an equally doubtful position as satirists or humorists; but Voltaire (q. v.) may fairly claim to rank among the former, in virtue

of his *Candide*, *Zadig*, *L'Ingénu*, *La Princesse de Babylone*, &c., most of which contain covert attacks on superstition and despotism, under the forms in which Voltaire best knew them. Voltaire, however, had not a rich imagination, and, in consequence, has been obliged to help himself liberally in the matter of incident from older writers.

4. *Fairy Tales, &c.*—A very careful inquiry might probably succeed in tracing back this kind of literature to the early intercourse of Christian and Moorish nations, but the first work in which we find definite examples of fairy tales is the *Nights* of the Italian novelist Straparola, translated into French in 1585. In this collection are found at least the outlines of some of the best-known stories of the sort, such as *Le Chat Botté* (Puss in Boots), *Prince Marcassin*, *Blanchebelle*, and *Fortunatus*. The immediate forerunner and prototype, however, of the French fairy tales was the *Pentamerone* of Signor Basile, written in the Neapolitan patois, and published in 1672. This work attracted and stimulated the fancy of M. Charles Perrault (q. v.), whose *Histoires ou Contes du Temps passé* appeared in 1697, and is incomparably the most naïve and charming of all the collections of fairy tales. The titles of some of his *contes* will recall many a literary feast of our childhood—*La Barbe Bleue* (Bluebeard), *La Belle au Bois Dormant* (The Sleeping Beauty, to which, by the by, Tennyson has given a poetic immortality), *Le Chat Botté* (Puss in Boots), *Riquet à la Houppe* (Riquet with the Tuft), and *Le Petit Chaperon Rouge* (Little Red Riding Hood). The principal successors of Perrault were the Comtesse d'Aunoy (see AUNOY), Madame Murat, and Mademoiselle de la Force; but their stories are much more extravagant and forced than those of the illustrious academicien. The same censure, however, is not applicable to *Les Contes Marins* (1740), by Madame Villeneuve, among which occurs the tale entitled *La Belle et la Bête* (Beauty and the Beast), perhaps the most beautiful creation in the whole circle of this fantastic form of fiction.

Meanwhile, the translation of the *Arabian Nights' Entertainments* (q. v.) by Galland, 1704—1717, and of numerous other Arabic and Persian works, the great encouragement extended to the literature of the East in the 17th and 18th centuries, the publication of the *Bibliothèque Orientale* of D'Herbelot, &c., created a taste for the brilliant exaggerations of oriental fiction, and a variety of works were soon in the field, swarming with necromancers, dervishes, califs, bashaws, viziers, cadis, eunuchs, slaves. The most notable of these are—*Les Mille et un Quart d'Heure*, *Contes Tartares*; *Les Contes Chinois, ou les Aventures Merveilleuses du Mandarin Fum-hoam*; and *Les Sultanes de Guzaratte, Contes Mongols*, of M. Gueulette.—Of the class of fictions known as *Voyages Imaginaires*, the principal are the *Histoire Comique des Etats et Empires de la Lune*, and the *Estats et Empires du Soleil* of Cyrano Bergerac, which materially influenced the genius of Swift, who has, in fact, borrowed not a little from the first of these in his *Gulliver's Travels*, and which were themselves partly suggested by the Spanish romance of Dominico Gonzales, entitled *The Man in the Moon*. Such novels as the *Paul et Virginie* of Bernardin St Pierre, which appeared towards the end of the 18th c., do not come under any of the four heads, but may most conveniently be mentioned here.

*Prose Fiction of Germany during the 18th and 19th Centuries.*—The limits of our space will not permit us to do more than superficially indicate the development of this branch of literature in Germany, which, however, is the less to be regretted, as, during the greater part of the 18th c., it did not attain much distinction. Towards the close

of the century, however, writers became more numerous, and as the literary activity of many of them continued on till the first or second quarter of the 19th c., it will be most convenient and natural to treat both centuries together, as they, properly speaking, form only one era in the literary history of that nation.

The first eminent German novelist of this period was Wieland (q. v.), whose Greek romances, *Agathon*, *Aristippus*, *Socrates*, &c., are of that didactic and sceptical character which was beginning to mark the reflective genius of the continent, and which has since produced such immense changes in all departments of thought. Wieland was followed by a crowd of writers, in whose productions is more or less distinctly apparent the influence of the English novelists, particularly of Richardson and Fielding, who had been translated and carefully studied in Germany, where, however, the 'novel of manners,' whether serious or comic, dealt more largely in the representation of 'family life.' The principal names are August la Fontaine, Wetzell, Müller (whose *Siegfried von Lindenberg* is still remembered and read), Schulz, and Hippel. Almost contemporary with these quiet and somewhat prosaic novelists, there flourished for a brief period (1780—1800) a school of an entirely opposite character, whose works, fiercely and outrageously romantic, had their poetic counterpart in Schiller's *Robbers*. They resemble, in their style of handling the feudal ages, the English romances of Mrs Radcliffe and others, which probably suggested them. The chief writers of this 'turbulent school of fiction,' as it has been called, are Cramer, Spiers, Schlenkert, and Veit Weber.

Alone, and far above all others in redundancy and originality of fancy, humour, and pathos, towers Jean Paul Richter (q. v.), who is incapable of classification, and to whom, therefore, his countrymen have affixed the epithet of *Der Einzige* (The Unique). Apart from all schools—in this respect, but in this only, like Richter—stands Johann Wolfgang Goethe (q. v.), whose novels, as well as his poems, are poetico-philosophic efforts to represent, perhaps to solve, the great facts and problems of human life and destiny.

The reaction from the materialism and irreligious levity of French thought, first shewed itself in Germany towards the close of the 18th c., in a certain earnest love and study of the old, simple, superstitious, and poetical beliefs of the middle ages. Hence originated the exquisite class of fictions called *Völkemärchen* (popular legends or tales), in which the Germans have never been equalled. The most illustrious cultivator of this species of fiction is Ludwig Tieck (q. v.), for Musæus (q. v.), though gifted with admirable powers of narration, is marked by a sceptical humour and irony, not altogether compatible with an imaginative conception of his subject. Other distinguished names are those of De la Motte Fouqué (q. v.), Chamisso (q. v.), Heinrich Steffens, Achim von Arnim (q. v.), Clemens Brentano (q. v.), Zschokke, and Hoffmann (q. v.). The most recent German novel of mark is *Sollen und Haben* (Debit and Credit), by Gustav Freytag (q. v.), in which the influence of Dickens is very conspicuous.

NOVELS AND ROMANCES OF THE 19TH CENTURY.—These have been produced in such overwhelming quantity, that volumes would be required merely to classify and characterise them. The vast and rapid increase in the material facilities of intercourse among European nations, which has taken place during the last forty years, has, among other results, tended to diffuse through each country the literary products of all the others, especially those of an

entertaining kind; and these have in turn more or less stimulated the imagination of native genius, so that at present there is hardly a people in Europe not even excluding Turkey, which has not contributed something to the enormous stock of fictions belonging to the 19th century. It would be altogether out of the question to attempt, in a compendious work like the present, a notice, however brief, of the principal novels and romances of every European nation; we can only refer to the historical surveys of literature, to be found under such heads as BELGIUM, BOHEMIA, HUNGARY, NETHERLANDS, NORWAY, POLAND, SWEDEN, TURKEY, &c. and to individual biographies of eminent continental novelists. Even in regard to England and France we can do little more than catalogue a few prominent names.

1. *English Fiction*.—Almost the first novelist that we encounter in the 19th c., Sir Walter Scott (q. v.), is probably the greatest that England, or even the world, has ever seen. Here, however, we have less to do with his personal rank in literature than with the kind of fiction that he cultivated. In qualified sense, he may be regarded as a continuation of the romantic school, but it must be observed that he is free from all their monstrosities, spasmodic tricks, and horrible machinery. Possessed at once of far greater antiquarian learning, imaginative genius, sound sense, and instinctive taste, than any of his 'romantic' predecessors, he knew precisely what to shun and what to choose; and though his *Feudal Age*, as depicted in *Ivanhoe*, *The Fair Maid of Perth*, &c., is a considerably idealised portrait of the rugged facts, it is a portrait, and not like Horace Walpole and Mrs Radcliffe's performances, a farious caricature. The political reaction that took place in Britain, after the sanguinary excesses of the French Revolution, assuming the form of a new and passionate attachment to venerable and time-honoured traditions, shewed itself in literature too, and Sir Walter Scott was its grandest representative. He strove to delineate the Past, as it seemed in the eyes of men who were dubious of the Present and afraid of the Future—noble, stately, glittering, and gay, with the pulse of life ever beating in heroic measures. The overpowering genius of Scott necessarily but unhappily (for the comfort of readers) led to 'endless imitation,' but the only one of his followers that held for a time a tolerably decent position in literature is G. P. R. James (q. v.). Galt (q. v.) and Wilson (q. v.), the former with vulgar but racy humour, the latter with a highly sentimental and overdone pathos, portrayed aspects of Scottish life which the author of *Waverley* has passed over. Other novelists, such as Lockhart (q. v.), Miss Ferrier (q. v.), and Mrs Johnstone, do not call for special notice; neither does Hope (q. v.), though his *Memoirs of Anastasius* is a most brilliant and powerful book; nor Moore (q. v.), though his *Epicurean* has all the sparkling and superficial splendours of his verse. After Scott, the next novelist who distinctly marks a new stage in the development of fiction, is Sir Edward Bulwer-Lytton (q. v.), in whose earlier works at least we find something like a reflection of the cold, sneering, selfish, and sensual spirit that marked the upper classes during the period of the Regency; but the versatile genius of this author, and the different fields in which he has won renown, would make it quite unfair to define him as a merely 'fashionable' novelist, though his first and least meritorious distinctions were acquired in that capacity, and students of *Sartor Resartus* are apt to so remember him. Of fashionable novelists, strictly so called, the best known are Mrs Gore (q. v.) and Thackeray Hook (q. v.). This class was succeeded by another

infinitely worse than itself—the *Newgate novelists*, as they have been well termed, who sought for their heroes among highwaymen, thieves, desperadoes, and murderers, like Jack Sheppard, Blueskin, Dick Turpin, Claude Duval, &c., and, flagitiously indifferent alike to fact and morality, laboured with pernicious success to invest the lives of these scoundrels with a halo of romantic interest and dignity. The chief of this school, 'by merit raised to that bad eminence,' is William Harrison Ainsworth (q. v.). During the last thirty years, novels have been multiplied to a degree which is almost alarming, and literally incalculable. The greatest names are unquestionably those of Dickens (q. v.), Thackeray (q. v.), and Miss Evans (q. v. in Supp.); but besides these might be mentioned a host of others, who have attained either celebrity or popularity, or both. Every mode of life, and every kind of opinion, social, artistic, scientific, philosophical, and religious, has sought to recommend itself by adopting this fascinating garb. We have the nautical novels of Marryat (q. v.), smelling, like Dibdin's songs, of the briny deep; the political novels of Disraeli (q. v.); the sporting and military novels of Lever (q. v.); the brilliant 'muscular Christian' novels of Kingsley (q. v.); the 'governess-novels,' as they have been aptly denominated, of Miss Brontë (q. v.); the 'school' novels of Hughes and Farrar; and the 'sensational' novels of Wilkie Collins, Miss Braddon, and others. Other authors not less eminent, but not so easily classified, are Mrs Gaskell, Mrs Norton, Miss Mulock (now Mrs Craik); and very recently, Mrs Oliphant (q. v.) and Charles Reade (q. v.); William Black, author of *A Daughter of Heth*, *The Adventures of a Phaeton*, and *A Princess of Thule*, who promises to become a finished artist. The extraordinary increase of this potent, and therefore perilous branch of literature cannot fail to excite much curious reflection in thoughtful minds, but it is not within our province to 'moralise the theme.'

2. *French Fiction during the 19th Century.*—A few words are all that we can devote to this part of our subject, though it is far from uninteresting either in a literary or a moral point of view. The effect of the Revolution of 1789 on literature was not immediately beneficial, but the reverse, though it planted the germs of a multitude of new thoughts and aspirations in the mind of Christendom, which have since yielded, both in France and elsewhere, a prolific harvest of wheat and—tares. The iron despotism of Napoleon crushed nearly all literary expression whatever. His hatred of 'idealogue' is well known, but the novel was that species of idealogic composition that came least into collision with the principles of imperialism. Even it, however, could hardly be said to flourish; and the only tolerably gifted writer of fiction who figures during the First Empire is Le Brun, and he was reduced to the necessity of caricaturing the *bourgeoisie*, to which Napoleon had no particular objection, as they were by no means his warmest admirers. Chateaubriand (q. v.) and Madame de Staël (q. v.) are insignificant in this department, and Charles Nodier, though voluminous, was not an original novelist. After the return of the Bourbons, and especially after the revolution of 1830, France began to display a wonderful literary activity, and in particular, its long-repressed faculty of imagination burst into a sudden blossom of poetry and fiction. Even Napoleon, now that he was dead, received a peculiar homage from the class to whom he had never shewn favour or regard, of which the songs of Béranger and *Les Misérables* of Victor Hugo afford us specimens. Unhappily for the purity of its literature, the régime of the Resto-

ration, which followed the deliverance of France from a military despotism, was itself a base, corrupt, and profligate thing. The Bourbons came back only to re-enact the follies of their ancestors in the previous century, and the nation soon came to despise, detest, and disbelieve them, and the church which supported them. Hence, a certain reckless levity, and hollow mocking laughter, as of heartless scepticism, pervading those fictions which profess to delineate the realities of current life. Moreover, the sparkling wit, the sunny humour, the pathos, often exquisitely tender and refined, the delicate or deep delineation of character, the occasional fine flush of sentimental enthusiasm, and the poetic witchery of a religious mysticism, cannot blind us to the fact that the substance of most of the recent French fictions is incurably immoral. Paul de Kock (q. v.), Balzac (q. v.), Dumas (q. v.), father and son, Sue (q. v.), Madame Dudevant (q. v.), though wholly dissimilar to each other in the quality of their genius, are wofully alike in the baser element of the national fiction. Victor Hugo (q. v.) and Lamartine (q. v.) are indeed morally far above the rest of their contemporaries, but they are perhaps the only great exceptions that can be mentioned. The 'Second Empire' did not improve the tone of the French novel, any more than it improved the tone of French society; but if it be true that when things have reached their worst they begin to mend, the country that has produced *La Dame aux Camélias* is perhaps, as regards the literature of fiction, in a hopeful condition. The tales of Messieurs Erckmann-Chatrian, in addition to their merits as graphic and picturesque delineations of provincial life in France, are honourably distinguished by the absence of all prurient sentimentality and indecent passion.

The prose fiction of Spain and Italy during the 19th c. scarcely requires notice, as the former country has not produced a single work that has forced its way into the general European market, while the latter can boast of only one that has attained that dignity, the *Promessi Sposi* of Manzoni (q. v.); but in a comprehensive sketch like the present, it would be a blemish to omit at least the names of the more eminent Transatlantic novelists, as they have contributed not a little of late years to the stock of English prose fiction. The most notable are Brockden Brown (q. v.), the American Godwin; Fenimore Cooper (q. v.), from whom Europe has been content, on the whole not unwisely, to take its notions of the forests, the prairies, and the red men of the West; Washington Irving (q. v.), Edgar Allan Poe (q. v.), Nathaniel Hawthorne (q. v.), Mrs Beecher Stowe (q. v.), Oliver Wendell Holmes (q. v.), and Bret Harte, in all of whose writings, except in the tales of Poe, is visible the influence of the life, traditions, scenery, and other salient characteristics of the New World. See Dunlop's *History of Fiction* (Lond. 1814), and Wolff's *Allgemeine Geschichte des Romans* (Jena, 1841, 2d edit. 1850).

NOVEMBER (Lat. *novem*, nine) was among the Romans the 9th month of the year, at the time when the year consisted of 10 months; and then contained 30 days. It subsequently was made to contain only 29, but Julius Cæsar gave it 31; and in the reign of Augustus the number was restored to 30, which number it has since retained. November was one of the most important months in connection with the religious ritual of the Romans, and continues in the same position, though for other reasons, in the Roman Catholic ritual. It was known among the Saxons as *Blot-monath*, 'blood-month,' on account of the general slaughter of cattle at this time, for winter provision (known for a long time afterwards as *Martinmas beef*) and for sacrifice. This custom

NUECES, a river of Texas, United States of America, rises in South-western Texas, lat. 30° long. 101° W., and after a south-easterly course of 300 miles, flows into Corpus Christi Bay, and through the Pass of the same name into the Gulf of Mexico.

NUISANCE is a legal term used to denote whatever is an annoyance to one's neighbours, or in a general sense to the public at large, in the exercise of their rights of property. The whole doctrine of nuisance is founded on the theory that every person is entitled to have the full use and enjoyment of his property, and of the right of passing to and fro on the highway without being interfered with or impeded by others, and whatever so impedes this full enjoyment of one's property and right of passage on the highway is a nuisance. Nuisances are thus capable of being divided into two kinds—private and public. Thus, if a neighbour leave a heap of rubbish emitting noxious smells close to A's windows, or make loud noises in his house, these may be said to be private nuisances, for they annoy A in the enjoyment of the fresh air and quiet which are part of his right of property. On the other hand, if something is put of the same kind on a public highway, or so as to annoy divers people equally and in the same manner, then it is called a public nuisance. One of the leading incidents of a nuisance is, that the party annoyed by it can in many cases, especially where the nuisance is injurious to health or life, take the law into his own hands and abate the nuisance without resorting to a court of law. The reason is, that the matter is of too urgent importance to await the slow progress of a suit at law, and mischief may be done in the meantime which would be often irreparable owing to the delay. Another important qualification of the right of abating a nuisance is, that the nuisance must be such that unless it is abated at once the party cannot exercise his legal rights; and hence if the nuisance is of such a kind that it does not directly interfere with the comfort or enjoyment of one's legal rights at the time, he has no right to abate it, but in that case is bound to resort to a court of law. This is best illustrated in the case of a nuisance on the highway, which is the class of cases in which the phrase a common nuisance is most familiarly known. Thus, if while A is riding or driving along the highway his progress is interrupted by a fence or gate which nobody has a legal right to put there, it is obvious that unless A can knock down or demolish at once this obstruction, he cannot proceed in the exercise of his legal right of using the highway. In such a case he has a right to demolish the gate and abate the nuisance, for it directly interferes with his own legal right. But if instead, a gate, a booth, or tent had been erected, not across the highway, but merely on one side of it, so as to leave room for passengers to pass, then though such tent or booth would be as undoubted a nuisance as in the other case, yet inasmuch as A can pass without direct interference, he has no right to abate the nuisance by destroying the tent. He must, in this latter case, resort to the legal remedy only. The same rule applies to all kinds of nuisances.

Another rule is, that in abating a nuisance the party is not to do unnecessary damage to property, i.e., more than simply abate the nuisance to such an extent as to enable himself to exercise his legal right, and no further. If he go beyond the immediate occasion, and cause unnecessary destruction to property, then he subjects himself to an action of damages. Hence it is often a difficult thing to know when one is justified in abating a nuisance and taking the law into his own hands.

Where the nuisance is sought to be removed by

legal means, then the remedy is in some cases twofold, and in some cases not so. Where the nuisance is of a private nature, an action of damages is in general the only remedy given by the common law. But where the nuisance is public, and affects all the public equally, or nearly so, then in general either an action may be brought, or an indictment will lie. Thus in case of a nuisance on a highway, as this affects all the lieges alike, an indictment is the proper remedy, though if an individual suffered special damage over and above what he suffers as one of the public, then he may bring an action. In Scotland, instead of an indictment, an action is the nature of a public action is raised, which is substantially similar in its results to an indictment.

As will be seen from what has preceded, the legal remedy in cases of nuisances has long been felt to be insufficient. To add to the other defects, there is great difficulty in determining whether a particular mode of using one's premises is in the nature of a nuisance or not; for if the line is drawn too narrowly, the rights of property and the natural freedom of the subject may be interfered with. On the other hand, things which formerly were considered no nuisances are now treated as such, owing to the spread of more enlightened views of public health and habits of cleanliness. These considerations recently induced the legislature to alter the common law in an important degree, and substitute a new code under the name of the Public Health and Nuisances Removal Acts, 11 and 12 Vict. c. 63; 18 and 19 Vict. c. 116; 35 and 36 Vict. c. 79. The general scheme of these acts is to enable districts to appoint local boards, with extensive powers of self-government, and to undertake and execute sanitary improvements, such as drainage and water supply on a large scale, paying for the expense thereof by a local rate or assessment.

As regards the power of removing nuisances, a statute was passed in 1855 for England, called the Nuisances Removal Act, which has been amended by two subsequent acts. By these acts, some sanitary authority, called rural or urban, under 35 and 36 Vict. c. 79, is appointed the local authority for carrying out the provisions of the act, and these are of an extensive kind. The act defines a nuisance to include any premises in such a state as to be a nuisance or injurious to health; any pool, ditch, gutter, water-course, privy, urinal, cess-pool, drain, or ashpit, so foul as to be a nuisance or injurious to health; any animal so kept as to be a nuisance, or injurious to health; and any accumulation or deposit, overcrowding, foul condition, or smoke. The local authority is to appoint a sanitary inspector at a proper salary. Any person aggrieved may give notice to the local board, or the sanitary inspector may do so. The local board has extensive powers; it can authorise its inspector, on reasonable complaint, to demand an entrance into any private premises so as to inspect their condition, and may order the removal of nuisances found to exist there. The local board, on finding a nuisance exists, direct their officer to go before a justice of the peace and procure an order directing the private party to abate the nuisance. If he refuse to do so, the local board may remove the nuisance at the expense of the party on whose premises it exists, and sue him for such expenses. If any candle-house, melting-house, soap-house, slaughter-house, or place for boiling off blood, bones, &c., be certified by the medical officer, or any two medical practitioners, to be a nuisance, or injurious to the health of the inhabitants of the neighbourhood, the local board may cause the person carrying on such trade to appear before a justice of the peace, and if it is not satisfactorily

proved that he does not use the best practicable means for preventing or counteracting the effluvia, he is fined. So if houses are overcrowded, this may be stopped. Provisions are also enacted with a view to prevent the spread of diseases in times of epidemics, and to prevent common lodging-houses being kept in a foul state. Another important provision relates to the seizure of diseased meat and provisions exposed to sale, and the medical officer of health, or inspector of nuisances, has at all times power to inspect any animal, carcase, meat, poultry, game, flesh, fish, fruit, vegetables, corn, bread, or flour; and if found unfit for food, or diseased, or unsound, they may be carried away then and there and destroyed, and the shopkeeper fined. The local authority may also order owners of houses to supply proper water-closets, and to cleanse gutters and cess-pools which are foul. Besides the above provisions as to nuisances generally, there are separate statutes which prohibit smoke nuisance in the English metropolis and the river Thames. Thus all the furnaces in mills, factories, printing-houses, dye-houses, distilleries, glass-houses, bakehouses, &c., within the metropolis, must be so constructed as to consume their own smoke, and also any noxious or offensive effluvia arising from any trade is prohibited. These statutes are the 16 and 17 Vict. c. 128, and 19 and 20 Vict. c. 107.

In Scotland, a Nuisances Removal Statute was passed in 1856, and was re-enacted by the Public Health Act, 1867, 30 and 31 Vict. c. 101. By that act the town council, or police commissioners of the place, are constituted the local authority for enforcing the act, and in other places the parochial board. Besides dealing with the same class of nuisances as the English act, the Scotch act provided for checking all trades and businesses offensive and injurious to the health of the neighbourhood. Similar powers were given to the local board to enter private houses and explore the causes of nuisances. Diseased and unwholesome meat and provisions may also be seized. Common lodging-houses were to be registered, and to be subject to rules and regulations to be made by the local authority. With regard to towns in Scotland, an extensive code of police laws was enacted in the General Police and Improvement Acts, 25 and 26 Vict. c. 101, 31 and 32 Vict. c. 102. The acts may be adopted by burghs; and villages above 700 of population may, by vote of householders, be converted into burghs for this purpose. A Smoke Nuisance Act for Scotland was passed applicable to all burghs, 20 and 21 Vict. c. 73; 24 Vict. c. 17; 28 and 29 Vict. c. 102.

The above is the usual legal acceptance of the term nuisance, but the word is sometimes used popularly to denote that class of nuisances, caused by disorderly houses or brothels, which are familiarly described as common nuisances. In the law of England those who keep a brothel are liable to be indicted for a misdemeanour, but as there was often a difficulty in setting the law in motion in such cases, a statute of 25 Geo. II. c. 36, enacted that if any two inhabitants should give notice to a constable of such a house being kept, it should then be the duty of the constable under a penalty, to go with such inhabitants before a justice and engage to prosecute the keeper, and their expenses are paid by the parish out of the poor-rates. The same act provided that whoever in point of fact acted as the master or mistress of the house, should be taken to be the keeper of the house. The punishment is fine and imprisonment. Of late an attempt has been made to convict a landlord under this statute when he knows of the character of his tenants, and refuses to give them notice to quit; but the courts have held that the mere fact of the

landlord refusing to give notice to quit, and so to eject such tenants, was not enough to make him liable in any criminal punishment. In Scotland, the offence of keeping a brothel is punishable in a similar manner. But apart from the keeping of a brothel, there is no criminal offence committed in this country by those who frequent such houses for the purposes of prostitution unless where the circumstances amount to Rape (q. v.) or Abduction (q. v.), or an aggravated assault.

NULLA BO'NA, a legal phrase in England, descriptive of the return made to a sheriff, who in executing process against a debtor finds he has no goods.

NUMA POMPTILIUS, in the mythic history of Rome, was the successor of Romulus, the founder of the city. He was a native of Cures in the Sabine country, and was universally revered for his wisdom and piety. Unanimously elected king by the Roman people, he soon justified by his conduct the wisdom of their choice. After dividing the lands which Romulus had conquered, he proceeded, with the assistance of the sacred nymph Egeria, to draw up religious institutions for his subjects, and thus stands out in the primitive legend as the author of the Roman ceremonial law. His reign lasted for 39 years, and was a golden age of peace and happiness. The only feature in the myth of N. P. which we can regard as probably historical, is that which indicates the infusion of a Sabine religious element into Roman history at some remote period.

NUMA'NTIA, the chief town of the Celtiberian people called Arevaci in ancient Spain, was situated on the Douro (Durius), in the neighbourhood of the present Soria in Old Castile. The site is probably marked by the present Puente de Guarray. N. is celebrated for the heroic resistance which it made to the Romans, from 153 B.C., when its citizens first met a Roman army in battle, to 134 B.C., when it was taken and destroyed by Scipio the younger, after a siege of 15 months, in the course of which famine and the sword had left alive very few of its 8000 brave defenders. The besieging force under Scipio amounted to 60,000 men.

NUMBERS, THEORY OF, the most subtle and intricate, and at the same time one of the most extensive, branches of mathematical analysis. It treats primarily of the forms of numbers, and of the properties at once deducible from these forms; but its principal field is the theory of equations, in as far as equations are soluble in whole numbers or rational fractions, and more particularly that branch known as Indeterminate Equations. Closely allied to this branch are those problems which are usually grouped under the Diophantine Analysis (q. v.), a class of problems alike interesting and difficult; and of which the following are examples: 1. Find the numbers the sum of whose squares shall be a square number; a condition satisfied by 5 and 12, 8 and 15, 9 and 40, &c. 2. Find three square numbers in arithmetical progression. Answer, 1, 25, and 49; 4, 100, 196, &c.

Forms of Numbers are certain algebraic formulas, which, by assigning to the letters successive numerical values from 0 upwards, are capable of producing all numbers without exception, e.g., by giving to  $m$  the successive values 0, 1, 2, 3, &c., in any of the following groups of formulas:  $2m$ ,  $2m + 1$ ;  $3m$ ,  $3m + 1$ ,  $3m + 2$ ;  $4m$ ,  $4m + 1$ ,  $4m + 2$ ,  $4m + 3$ , we can produce the natural series of numbers. These formulas are based on the self-evident principle, that the remainder after division is less than the divisor, and that, consequently, every number can be represented in the form of the product of two factors + a number less than the smaller factor.

By means of these formulas, many properties of numbers can be demonstrated without difficulty. To give a few examples. (1.) *The product of two consecutive numbers is divisible by 2:* Let  $2m$  be one number, then the other is either  $2m + 1$  or  $2m - 1$ , and the product  $2m(2m \pm 1)$  contains 2 as a factor, and is thus divisible by 2. (2.) *The product of three consecutive numbers is divisible by 6:* Let  $3m$  be one of the numbers (as in every triad of consecutive numbers one must be a multiple of 3), then the others are either  $3m - 2$ ,  $3m - 1$ ;  $3m - 1$ ,  $3m + 1$ ; or  $3m + 1$ ,  $3m + 2$ . In the first and third cases, the proposition is manifest, as  $(3m - 2)(3m - 1)$ , and  $(3m + 1)(3m + 2)$ , are each divisible by 2, and therefore their product into  $3m$  is divisible by 6 ( $= 1.2.3$ ). In the second case the product is  $3m(3m - 1)(3m + 1)$ , or  $3m(9m^2 - 1)$ , where 3 is a factor, and it is necessary to shew that  $m(9m^2 - 1)$  is divisible by 2; if  $m$  be even, the thing is proved; but if odd, then  $m^2$  is odd,  $9m^2$  is odd, and  $9m^2 - 1$  is even; hence, in this case also the proposition is true. It can similarly be proved that the product of four consecutive numbers is divisible by 24 ( $= 1.2.3.4$ ), of 5 consecutive numbers by 120 ( $= 1.2.3.4.5$ ), and so on generally. These propositions form the basis for proof of many properties of numbers, such as that the difference of the squares of any two odd numbers is divisible by 8. The difference between a number and its cube is the product of three consecutive numbers, and is consequently (see above) always divisible by 6. Any prime number which, when divided by 4, leaves a remainder unity, is the sum of two square numbers: thus,  $41 = 25 + 16 = 5^2 + 4^2$ ,  $233 = 169 + 64 = 13^2 + 8^2$ , &c.

Besides these, there are a great many interesting properties of numbers which defy classification; such as, that the sum of the odd numbers beginning with unity is a square number (the square of the number of terms added), i. e.,  $1 + 3 + 5 = 9 = 3^2$ ,  $1 + 3 + 5 + 7 + 9 = 25 = 5^2$ , &c.; and, the sum of the cubes of the natural numbers is the square of the sum of the numbers, i. e.,  $1^3 + 2^3 + 3^3 = 1 + 8 + 27 = 36 = (1 + 2 + 3)^2$ ,  $1^3 + 2^3 + 3^3 + 4^3 = 100 = (1 + 2 + 3 + 4)^2$ , &c.

We shall close this article with a few general remarks on numbers themselves. Numbers are divided into *prime* and *composite*—prime numbers being those which contain no factor greater than unity; composite numbers, those which are the product of two (not reckoning unity) or more factors. The number of primes is unlimited, and so consequently are the others. The product of any number of consecutive numbers is even, as also are the squares of all even numbers; while the product of two odd numbers, or the squares of odd numbers, are odd. Every composite number can be put under the form of a product of powers of numbers; thus,  $144 = 2^4 \times 3^2$ , or generally,  $n = a^p b^q c^r$ , where  $a$ ,  $b$ , and  $c$  are prime numbers, and the number of the divisors of such a composite number is equal to the product  $(p + 1)(q + 1)(r + 1)$ , unity and the number itself being included. In the case of 144, the number of divisors would be  $(4 + 1)(2 + 1)$ , or  $5 \times 3$ , or 15, which we find by trial to be the case. *Perfect numbers* are those which are equal to the sum of their divisors (the number itself being of course excepted); thus,  $6 = 1 + 2 + 3$ ,  $28 = 1 + 2 + 4 + 7 + 14$ , and 496, are perfect numbers. *Amicable numbers* are pairs of numbers, either one of the pair being equal to the sum of the divisors of the other; thus,  $220 (= 1 + 2 + 4 + 5 + 10 + 11 + 20 + 22 + 44 + 55 + 110 = 284)$ , and  $284 (= 1 + 2 + 4 + 71 + 142 = 220)$ , are amicable numbers. For other series of numbers, see FIGURATE NUMBERS.

The most ancient writer on the theory of numbers was Diophantus, who flourished in the 3d c., and the subject received no further development till the time of Vieta and Fermat (the latter being the author of several celebrated theorems, a discussion of which, however, is quite unsuited to this work who greatly extended it. Euler next added his quota, and was followed by Lagrange, Legendre, and Gauss, who in turn successfully applied themselves to the study of numbers, and brought them to its present state. Cauchy, Libri, and Gill (America), have also devoted themselves to it with success. The chief authorities down to the present century are Barlow's *Theory of Numbers* (1811), Legendre's *Essai sur la Théorie des Nombres* (third ed. Paris, 1830), and Gauss's *Disquisitiones Arithmeticae* (Brunswick, 1801; Fr. translation 1807); and for the latest discoveries, the transactions of the various learned societies may be consulted.

NUMBERS (LXX. *Arithmoi*; Heb. *Bamidbar*) the fourth book of the Pentateuch, consists of 11 chapters, embracing the history of the march of the Israelites through the Desert, together with the special laws given during this period as complementary to the Sinaitic legislation. Beginning with the census of the people (whence the name of the book), and the assigning of the special places to each tribe with reference to the sanctuary, the whole people is classified, and the tribe of Levi specially singled out. Ordinances on the purity to be maintained in the camp, the functions of the priests, as a description of the passover, follow. The second portion of the book describes the journey from Sinai to the borders of Canaan, the miraculous sustenance of the people, their dissatisfaction and consequent rejection, together with various special laws respecting sacrifices, &c., and the episode of Korah. The third part embraces the first ten months of the fortieth year of the wandering—epoch hurried over with remarkable swiftness by the historian. In quick succession, the removal of the people with their leaders, the message to the king of Moab, the death of Aaron, the defeat of the king of Arad, the punishment of the people by serpents, the march from Hor to Pisga, and the victorious battle against the kings of Sihon and Og, are recounted, and the extraordinary episode of Balaam follows. The further wiles employed by the alarmed Moabites and Midianites to avert the threatening invasion, and their result, together with the second census, are narrated. Moses is warned of his death, and the vital question of his succession is settled. Further laws and ordinances respecting sacrifices and vows, the conquest of the Midianites, and the partition of the country east of the Jordan among certain tribes, a recapitulation of the encampments in the Desert, a detailed specification of the manner in which the promised land should be divided after its conquest, and the final ordinance of the marriages of heiresses among their own tribe only, so as to preserve the integrity of landed property, make up the remainder of the book.

The Book of Numbers is, like the rest of the Pentateuch, supposed by the greater part of modern critics to consist of several documents written by *Elohist*s and *Jehovist*s respectively. See GENESIS, PENTATEUCH.

NUMERALS, the general name given to figures or symbols by means of which numbers are expressed (for Roman and Greek numerals, see NOTATION); the distinctive name of *Arabic Numerals* being given to the nine figures or digits and the zero, that are now in almost universal use among civilised nations for this purpose. Both the origin

these figures, and the period at which they became known in Europe, have been made subjects of laborious investigation; and it seems to be now proved beyond a doubt that they are of Indian not Arabic origin, and were invented by the Brahmins some time B.C. But the more important inquiry as to the time of their introduction into Europe has hitherto baffled all research. The simple and convenient theory, that they were introduced into Spain by the conquering Arabs, and from that country, then a great seat of learning, a knowledge of them was disseminated throughout Europe, is contradicted by the fact that the eastern Arabs themselves had no knowledge of them previous to the time of the Calif Al-Mamun (813—833), while a knowledge of them existed in Europe from a considerably earlier date. The most probable theory is, that they were brought from India, probably by the Neo-Pythagoreans, and introduced into Italy, whence they became known to a few of the learned men of Eastern Europe. We have, however, every reason to suppose that the figures then known were totally different in form from those now used. These latter, called *Gobar* by the Arabs, may have been brought to Bagdad during the reign of Al-Mansur (760), or his immediate successors, and certainly not later than the time of Al-Mamun. During the latter reign we know the present system of arithmetic was introduced into Persia from India, and most probably a knowledge of the *Gobar* figures at the same time. Thence the system of arithmetic was brought to north-western Africa and Spain, and doubtless the figures along with it, about the end of the 10th or beginning of the 11th century, and from Spain a knowledge of both was speedily communicated to the rest of Europe, the *Gobar* figures superseding those forms of Eastern figures which had previously been employed. The knowledge of the figures however spread, as was natural, much more rapidly than the notation and arithmetic of which they were the foundation, and we consequently find in writings and inscriptions of the middle ages the *Gobar* figures partly substituted for, and mixed up with, the Roman numerals; as, for instance, XXX2, for 32; X4, for 14, &c.; and occasionally such expressions as 302, 303, for 32 and 33. The earliest work on modern arithmetic was published in Germany in 1390; it explained the decimal notation, and exemplified the elementary rules. The Arabic numerals were not generally introduced into England till the commencement of the 17th c., and it was long after that time before the decimal arithmetic became general. See a dissertation *Sur les Chiffres Indiens*, by M. Woepke, in the Asiatic journal.

NUMERATION, the reading off of numbers that are expressed by figures. As shewn in Notation (q. v.), the first figure on the right hand expresses units; the next, tens; the third, hundreds; and following the same nomenclature with the next three figures, we have the fourth expressing units of thousands; the fifth, tens of thousands; the sixth, hundreds of thousands. The seventh figure, in like manner, expresses units of millions; the eighth, tens of millions; and the ninth, hundreds of millions. When this method is consistently followed out, as is the case with French and other continental arithmeticians, the fourth period, or group of three figures, is denominated billions, the first figure of it

(the tenth from the extreme right) being, units of billions; the next, tens of billions; &c. Read in this way, the figures 56,084,763,204,504 express fifty-six trillions, eighty-four billions, seven-hundred-and-sixty-three millions, two-hundred-and-four thousands, five-hundred-and-four units. In Britain, there is a slight variation in the mode, the only effect of which is to render it a little more complicated: thus, after units of millions, come tens and hundreds of millions, but then instead of billions we have, according to the current usage, thousands of millions; after this, tens of thousands of millions and hundreds of thousands of millions, and then billions, which occupy the 13th figure from the right, and are reckoned in the same way as millions, so that the next unit or *trillions* does not come in till the 19th figure. The above number, according to the British mode, would be read fifty-six billions, eighty-four-thousand-seven-hundred-and-sixty-three millions, two hundred-and-four thousands, five-hundred-and-four units. The first method is perfectly symmetrical, keeping throughout to divisions of three figures; the second only keeps to this division up to hundreds of millions, when it changes it for a division into parcels of six figures, which are named from units up to hundreds of thousands of units. The latter mode is, however, gradually falling into disuse.

NUMIDIA (Gr. *Nomadia*, the land of Nomads), the name given by the Romans to a part of the north coast of Africa, corresponding to some extent with the modern Algiers. It was bounded on the W. by the river Mulucha (now *Moluya*), which separated it from Mauritania; on the E. by the river Tusca (now *Wadi-el-Berber*), which separated it from the territory of Carthage, the *Africa Propria* of the Romans; on the south, it reached to the chains of Mount Atlas and the *Lacus Tritonis*, which separated it from the land of the Gaetulians and Interior Libya. The chief rivers were the *Rubricatus* and the *Ampsaga*. The inhabitants of N., as of Mauritania, belonged to the race from which the modern Berber are descended. They were a warlike race, and excelled as horsemen; but, like most barbarians, were faithless and unscrupulous. Of their tribes, the *Massyli* in the east, and the *Masaesyli* in the west, were the most powerful. In the grand struggle between the Carthaginians and the Romans, they at first fought on the side of the former, but subsequently the king of the Eastern Numidians, Massinissa, joined the Romans, and rendered them effectual service in the war with Hannibal. Favoured by the conquerors, he united all N. under his sway. Of his successors in this kingdom, Jugurtha and Juba are the most famous. After the victory of Caesar over Juba I., in the African war, N. became a Roman province (46 B.C.); but Augustus afterwards gave the western part—from the river Ampsaga, now *Wadi-el-Kibbir*—with Mauritania, to Juba II., and the name N. became limited to the eastern part; and when Mauritania became a Roman province, the western part was called Mauritania *Cæsariensis*. Among the Roman *coloniae* were Hippo Regius, near the mouth of the river Rubricatus; Cirta (the residence of the Numidian kings), afterwards called Constantina, a name still preserved in Constantine; Sicca, and Rusicada. For the modern history of N. see ALGIERS.
